Figures 5 and *6* show the timing diagrams for serial data entry and extraction for the 31-word by 16-bit FIFO shown in *Figure 4*. The final position of data after serial insertion of 496 bits into the FIFO array of *Figure 4* is shown in *Figure 7*.

All applications shown for 'F403 can be adapted to the 'F433 with the depth of the stack being 64 locations rather than the 16 locations of 'F403.

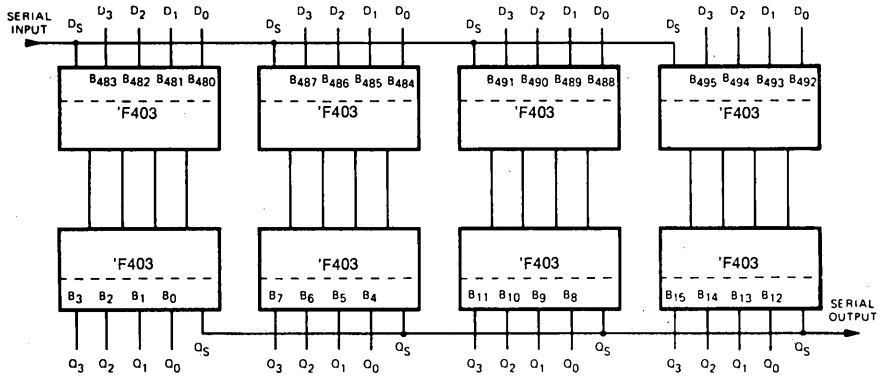

FIG. 7
FINAL POSITION OF A 496-BIT SERIAL INPUT

Interlocking Circuitry—Most convential FIFO designs provide status signals analogous to $\overline{IRF}$ and $\overline{ORE}$. However, when these devices are operated in arrays, variations in unit to unit operating speed require external gating to assure all devices have completed an operation. The 'F403 incorporates simple but effective "master/slave" interlocking circuitry to eliminate the need for external gating.

In the 'F403 array of *Figure 4* devices 1 and 5 are defined as "row masters" and the other devices are slaves to the master in their row. No slave in a given row will intialize its Input Register until it has received LOW on its $\overline{IES}$ input from a row master or a slave of higher priority.

In a similar fashion, the $\overline{ORE}$ outputs of slaves will not go high until their $\overline{OES}$ inputs have gone HIGH. This interlocking scheme ensures that new input data may be accepted by the array when the $\overline{IRF}$ output of the final slave in that row goes LOW and that output data for the array may be extracted when the $\overline{ORE}$ of the final slave in the output row goes HIGH.

The row master master is established by connecting its $\overline{IES}$ input to ground while a slave receives its $\overline{IES}$ input from the $\overline{IRF}$ output of the next higher priority device. When an array of 'F403 FIFOs is intialized with a LOW on the $\overline{MR}$ inputs of all devices, the $\overline{IRF}$ outputs of all devices will be HIGH. Thus, only the row master receives a LOW on the $\overline{IES}$ input during initialization. *Figure 8* is a conceptual logic diagram of the internal circuitry which determines master/slave operation. Whenever $\overline{MR}$ and $\overline{IES}$ are LOW, the Master Latch is set. Whenever $\overline{TTS}$ goes LOW the Request Initialization Flip-Flop will be set. If the Master Latch is HIGH, the Input Register will be immediately initialized and the Request Initialization Flip-Flop reset. If the Master Latch is reset, the Input Register is not initialized until $\overline{IES}$ goes LOW. In array operation, activating the $\overline{TTS}$ initiates a ripple input register initialization from the row master of the last slave.

A similar operation takes place for the output register. Either a $\overline{TOS}$ or TOP input intiates a load-from-stack operation and sets the ORE Request Flip-Flop. If the Master Latch is set, the last Output Register Flip-Flop is set and $\overline{ORE}$ goes HIGH. If the Master Latch is reset, the $\overline{ORE}$ output will be LOW until an $\overline{OES}$ input is received.

32-BIT MEMORY ERROR DETECTION AND CORRECTION CIRCUIT

DESCRIPTION — The 'F418 memory Error Detection And Correction (EDAC) circuit contains the logic to generate seven check bits on a 32-bit data field, according to a modified Hamming code. The check bits are then stored in memory with the data word. On a subsequent read from memory, the device will detect and correct any single-bit data error, and detect any double-bit error.

The 'F418 is fully compatible with all TTL families. Data and check-bit signals are bidirectional 3-state lines.

- **INCREASES MEMORY SYSTEM RELIABILITY**
- **CORRECTS SINGLE-BIT ERRORS**
- **DETECTS DOUBLE-BIT ERRORS**

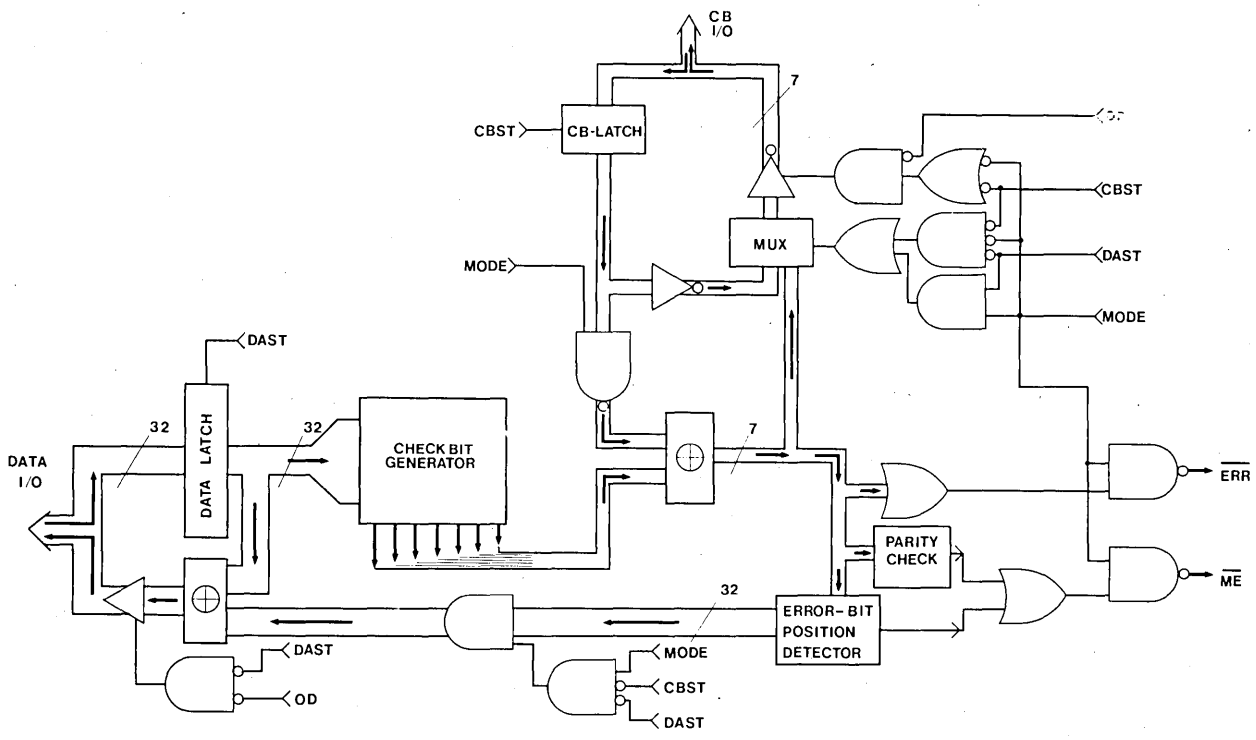
LOGIC DIAGRAM



PIN NAMES

PIN NAME	DESCRIPTION	COMMENTS
D_{00}–D_{31}	Data I/O Lines	32 bidirectional data lines. D_{00} is the least significant bit.
CB_0–CB_6	Check Bit I/O Lines	Seven bidirectional check bit lines used to output the check bits on memory write operations and to put the fail pattern syndromes during correction. CB_0 is the least significant bit.
DAST	Data Strobe	Used to strobe data into the data latches. When DAST is HIGH the outputs of the data latches follow the input data lines (D_{00}–D_{31}). When DAST is LOW the input data lines are latched into the data latches. In addition, when DAST is HIGH the data output drivers on the 32 bidirectional data lines are inhibited. These data output drivers are enabled when DAST is LOW and OD is LOW (see Function Table and Block Diagram).
OD	Output Disable	When OD is HIGH the 39 data/CB line drivers are in the high impedance state regardless of the state of the DAST, CBST and MODE inputs. When OD is LOW, the 32 data I/O lines and 7 check bits I/O lines may be either outputs and/or inputs depending on the states of the DAST, CBST and MODE inputs.
$\overline{ME}$	Multiple Error	With the MODE input HIGH the $\overline{ME}$ output goes LOW whenever 2 or more bit errors have occurred in the memory word (data and check bits). When LOW, indicates a non-correctable error.

© IC MASTER 1983

PIN NAMES

PIN NAME	DESCRIPTION	COMMENTS
$\overline{ERR}$	Error	With the MODE input HIGH the $\overline{ERR}$ output goes LOW whenever a single or double bit error has occurred in the memory word (data and check bits).
MODE	Mode	The MODE input in conjunction with DAST and CBST inputs determines the internal function performed. A HIGH on the MODE input specifies the monitor/correct operation while a LOW specifies the generate/read operation.
CBST	Check Bit Strobe	Used to strobe data into the check bit latches. When CBST is HIGH the outputs of the check bit (CB) latches follow the input check bit lines. When CBST is LOW the input check bit lines are latched into the CB latches. The check bit output drivers are controlled by CBST, MODE and OD inputs as indicated in the Function Table (Block Diagram).

D19	X	X	X	–	–	X	X	CB6	X	–	–	–	–	–	–

NOTES:

1.) During generate mode, MODE is LOW, CB2 through CB6 are calculated so that the indicated bits there are an even number of ones (i.e. even parity) while CB0, CB1 and CB6 are calculated for an odd number of ones. This modification of the Hamming code makes the device respond to a memory read of all ones or all zeros (all 39 bits) with a $\overline{ME}$ indication.

2.) During correction mode, with DAST LOW and CBST LOW, the fail pattern will be placed on the CB I/O lines. Each zero in the fail pattern indicates a discrepancy between that particular bit in the input (or latched) checkbit (based on D0 through D31). A fail pattern of all ones indicates no error. A single zero indicates that the corresponding check bit is in error and no correction of the data is required. This situation is still flagged with a LOW $\overline{ERR}$.

Preliminary

54F/74F500

6-BIT ANALOG-TO-DIGITAL CONVERTER

DESCRIPTION—The 'F500 is a 6-bit, fully parallel analog-to-digital converter capable of sampling at rates from 0 to 70 MHz. Conversion is accomplished by 64 comparators spaced one quanta apart on a voltage reference ladder. All comparators measure the analog input against their reference simultaneously. The most significant comparator that finds the analog input to be greater than its reference has its output encoded to a 6-bit, active-HIGH binary number, stored in latches. Two polarity control inputs are provided: P_M complements the most significant output bit and P_N complements the lesser five output bits. The circuit operates from +5.0 V and −6.0 V supplies and has separate digital and analog grounds. Both ends of the reference ladder are brought out, one to V_{RT} (nominally zero volts) and the other to V_{RB} (nominally −1.0 V).

- **NO SAMPLE AND HOLD REQUIRED**
- **SAMPLING RATE 70 MHz TYP**
- **APERTURE TIME 4.0 ns TYP**
- **V_{CC} SUPPLY CURRENT 23mA TYP**
- **V_{EE} SUPPLY CURRENT 93 mA TYP**
- **PIN COMPATIBLE WITH TDC 1014J**

MEMORY MAPPER
(WITH 3-STATE OUTPUTS AND OUTPUT LATCHES)

DESCRIPTION— The 'F610, 'F612 memory mappers are designed to expand the address capability at a Central Processing Unit (CPU) by eight bits. The devices contain 16 map registers, each containing 12 bits, that are loaded by the CPU. Subsequently, the four most significant bits of the memory address select one of the 16 registers. The 12 output bits, plus the four least significant memory address bits, form the expanded address. In this mode the 'F610 output stages may be transparent or latched. The addressable memory space is increased by periodically reloading the map registers.

In the pass mode the address bits on the register select inputs appear as the most significant bits at the map outputs, with LOW levels appearing on the other bit positions.

- **INCREASE ADDRESSING CAPABILITY BY EIGHT BITS**
- **DESIGNED FOR PAGED MEMORY MAPPING**
- **OUTPUT LATCHES ON 'F610**
- **3-STATE OUTPUTS**

PIN NAMES

PIN NAME	DESCRIPTION	COMMENTS
I/O_0–I/O_{11}	Data I/O Lines	I/O connections to data and control bus used for reading from and writing to the map register selected by RS_0–RS_3 when $\overline{CS}$ is LOW. MODE controlled by R/$\overline{W}$.
RS_0–RS_3	Register Select Inputs	Register select inputs for I/O operations.
R/$\overline{W}$	Read/Write Control Input	Read or write control used in I/O operations to select the condition of the data bus. When HIGH, the data bus outputs are active for reading the map register. When LOW, the data bus is used to write into the register.
STB	Strobe Input	Strobe input used to enter data into the selected map register during I/O operations.
CS	Chip Select	Chip select input. A low input level selects the memory mapper (assuming more than one used) for an I/O operation.
MA_0–MA_3	Map Address Inputs	Map address inputs to select one of 16 map registers when in map MODE ($\overline{MM}$ LOW and $\overline{CS}$ HIGH).
MO_0–MO_{11}	Map Outputs	Map outputs. Present the map register contents to the system memory address bus in the map MODE. In the pass MODE, these outputs provide the map address data on MO_8–MO_{11} and LOW levels on MO_0–MO_7.
$\overline{MM}$	Map Mode Input.	Map MODE Input. When LOW, 12 bits of data are transferred from the selected map register to the map outputs. When HIGH (pass MODE), the 4 bits present on the map address inputs are passed to the map outputs.
$\overline{ME}$	Map Enable	Map enable for the map outputs.A LOW level allows the outputs to be active while a HIGH input level puts the outputs at HIGH impedence.
LE	Latch Enable ('F610 Only)	Latch enable input for the 'F610 (no internal connection for 'F612). A HIGH level will transparently pass data to the map outputs. A LOW level will latch the outputs.

F100K ECL Logic

Fairchild's entire F100K logic family is in volume production *now*. The family, the industry standard for speed, includes a full complement of gates, flip-flops, latches, counters, shift registers, and arithmetic functions.

F100K utilizes Fairchild's Isoplanar II process along with voltage and temperature compensation networks to bring you the circuits you need when system performance is a must.

See next page for Data Book information.

FACT™ Description and Family Characteristics

The Fairchild Advanced CMOS Technology, FACT,™ is Fairchild's proprietary, isoplanar, fully ion-implanted, silicon-gate process. FACT™ employs state-of-the-art techniques in projection photolithography, planar plasma etching, low pressure chemical vapor deposited (LPCVD) thin films and sputter metallization. With a nominal effective channel length of 2.5 μm, 500 angstrom gate oxide and 4 μm design rules, the process is ideal for fabricating high speed, high density CMOS logic/memory circuits. *Figure 2-1* shows the progress of CMOS technology since the 6 μm metal gate 4000 Series technology. *Figure 2-1a* shows the cross-section of a single stage inverter, fabricated by the standard 6 μm metal gate technology, which is still commonly used by many manufacturers to produce the 4000B Series CMOS devices. In 1973, Fairchild introduced the F4000 Series CMOS logic, which was fabricated with a 6 μm, silicon gate, oxide-isolation technology. This technology combines local oxide isolation techniques with silicon gate technology to achieve approximately 35% savings in area, as shown in *Figure 2-1b*. Operating speeds were increased due to self-alignment of the silicon gate and reduced sidewall capacitance. This is evident in the high speed performance of the Fairchild 4000B CMOS Series. Over the years, Fairchild has continued to improve the CMOS process. FACT™ is the result of such development effort and is backed-up by nine years of manufacturing experience in silicon-gate CMOS logic devices. As shown in *Figure 2-1c,* it is apparent that devices fabricated with FACT™ are substantially smaller than those made with the other two processes. Much higher density and complexity in circuit designs may be achieved. Another major advantage of FACT™ is that smaller geometry enables the device to operate at a higher speed. Logic gates manufactured with FACT™ can operate in excess of 20 MHz - 30 MHz while driving a 50 pF load with a typical output short circuit current of 55 mA.

LOW level-to-high impedance	t_{PLZ}	X		
High impedance-to-HIGH level	t_{PZH}	X		
High impedance-to-LOW level	t_{PZL}	X		

Notes:
1. By placing a defining min or max in front of definition, the limits can change from min to max, or vice versa.
2. Clock input waveform should have a 50% duty cycle and be such as to cause the outputs to be switching from 10% V_{CC} to 90% V_{CC} in accordance with the device truth table.

HD-4702
CMOS PROGRAMMABLE BIT RATE GENERATOR

Features

- HD-4702 – PROVIDES 13 COMMONLY USED BIT RATES
- USES A 2.4576MHz CRYSTAL/INPUT FOR STANDARD FREQUENCY OUTPUT (16 TIMES BIT RATE)
- TTL COMPATIBLE – OUTPUT WILL SINK 1.6mA
- LOW POWER DISSIPATION 4.5mW TYP. @ 2.4576MHz
- CONFORMS TO EIA RS-404
- ONE HD-4702 CONTROLS UP TO EIGHT TRANSMISSION CHANNELS
- INITIALIZATION CIRCUIT FACILITATES DIAGNOSTIC FAULT ISOLATION
- ON-CHIP INPUT PULL-UP CIRCUIT

Description

The HD-4702 Bit Rate Generator provides the necessary clock signals for digital data transmission systems, such as a UART. It generates 13 commonly used bit rates using an on-chip crystal oscillator or an external input. For conventional operation generating 16 output clock pulses per bit period,the input clock frequency must be 2.4576MHz (i.e. 9600 Baud x 16 x 16, since there is an internal÷16 prescaler). A lower input frequency will result in a proportionally lower output frequency.

The HD-4702 can provide multi-channel operation with a minimum of external logic by having the clock frequency CO and the ÷8 prescaler outputs Q_0, Q_1, Q_2 available externally. All signals have a 50% duty cycle except 1800 Baud and 2000 Baud, which has less than 0.39% distortion and 3600 Baud, which has less than 0.78% distortion.

The four rate select inputs (S_0-S_3) select which bit rate is at the output (Z). The table lists select code and output bit rate. Two of the 16 for the HD-4702 do not select an internally generated frequency, but select an input into which the user can feed either a different frequency, or a static level (High or Low) to generate "ZERO BAUD".

The bit rate most commonly used in modern data terminals (110, 150, 300, 1200, 2400 Baud) require that no more than one input be grounded for the HD-4702, which is easily achieved with a single 5-position switch.

The HD-4702 has an initialization circuit which generates a common master reset for all flip-flops. This signal is derived from a digital differentiator that senses the first high level on the CP input after the $\overline{E}_{CP}$ input goes low. When $\overline{E}_{CP}$ is high, selecting the crystal input, CP must be low. A high level on CP would apply a continuous reset.

For the HD-4702, all inputs except I_X have on-chip pull-up circuits which provide TTL compatibility and eliminate the need to tie a permanently high input to V_{CC}.

	t_s t_h	Set-Up Time, I_M to CO Hold Time, I_M to CO	350 0			350 0			ns ns	C_L = 15pF, Input Transition Times ≤ 20ns
	$t_{WCP(L)}$ $t_{WCP(H)}$	Minimum Clock Pulse-Width Low and High ③ ④	120 120			120 120			ns ns	
	$t_{WCP(L)}$ $t_{WCP(H)}$	Minimum I_X Pulse Width, Low and High ④	160 160			160 160			ns ns	

NOTES:

① Input Current and Quiescent Power Supply Current are relatively higher for this device because of active pull-up circuits on all inputs except I_X. This is done for TTL compatibility.
② Propagation Delays (t_{PLH} and t_{PHL}) and Output Transistion Times (t_{TLH} and t_{THL}) will change with Output Load Capacitance (C_L). Set-Up Times (t_s), Hold Times (t_h), and Mininum Pulse Widths (t_w) do not vary with load capacitance.
③ The first High Level Clock Pulse after $\overline{E}_{CP}$ goes Low and must be at least 350ns long to guarantee reset of all Counters.
④ It is recommended that input rise and fall times to the Clock Inputs (CP, I_X) be less than 15μs.
⑤ For multichannel operation, Propagation Delay (CO to Q_n) plus Set-Up Time, Select to CO, is guaranteed to be ≤ 367ns.

HD-6402

CMOS/LSI Universal Asynchronous Receiver Transmitter (UART)

Features

- OPERATION FROM D. C TO 2.0MHz @ 5.0 VOLTS
- LOW POWER-TYP. 10mW @ 2.0MHz AND 5.0 VOLTS
- PROGRAMMABLE WORD LENGTH, STOP BITS AND PARITY
- AUTOMATIC DATA FORMATTING AND STATUS GENERATION
- COMPATIBLE WITH INDUSTRY STANDARD UART'S
- SINGLE POWER SUPPLY

Description

The HD-6402 is a CMOS/LSI subsystem for interfacing computers or microprocessors to an asynchronous serial data channel. The receiver converts serial start, data, parity and stop bits to parallel data verifying proper code transmission, parity, and stop bits. The transmitter converts parallel data into serial form and automatically adds start, parity, and stop bits. The data word length can be 5, 6, 7 or 8 bits. Parity may be odd or even. Parity checking and generation can be inhibited. The stop bits may be one or two or one and one-half when transmitting 5 bit code.

The HD-6402 can be used in a wide range of applications including modems, printers, peripherals and remote data aquisition systems. CMOS/LSI technology permits operation clock frequencies up to 2.0MHz (125K Baud) an improvement of 10 to 1 over previous PMOS UART designs. Power requirements, by comparison, are reduced from 300mW to 10mW. Status logic increases flexibility and simplifies the user interface.

Transmitter Operation

The transmitter section accepts parallel data, formats it and transmits it in serial form on the TROutput terminal. Ⓐ Data is loaded into the transmitter buffer register from the inputs TR1 through TR8 by a logic low on the TBRLoad input. Valid data must be present at least t_{SET} prior to and t_{HOLD} following the rising edge of TBRL. If words less than 8 bits are used, only the least significant bits are used. The character is right justified into the least significant bit, TR1. Ⓑ The rising edge of TBRL clears TBREmpty. 0 to 1 clock cycles later, data is transferred to the transmitter register, TREmpty is cleared, TBREmpty is set high, and serial data transmission is started. Output data is clocked by TRClock. The clock rate is 16 times the data rate. Ⓒ A second pulse on TBRLoad loads data into the transmitter buffer register. Data transfer to the transmitter register is delayed until transmission of the current character is complete. Ⓓ Data is automatically transferred to the transmitter register and transmission of that character begins one clock cycle later.

NOTE ①: All devices guaranteed at worst case limits. Room temperature, 5V data provided for information-not guaranteed.

Receiver Operation

Data is received in serial form at the RInput. When no data is being received, RInput must remain high. The data is clocked through the RRClock. The clock rate is 16 times the data rate. Ⓐ A low level on DRReset clears the DReady line. Ⓑ During the first stop bit data is transferred from the receiver register to the RBRegister. If the word is less than 8 bits, the unused most significant bits will be a logic low. The output character is right justified to the least significant bit RBR1. A logic high on OError indicates overruns. An overrun occurs when DReady has not been cleared before the present character was transferred to the RBRegister. Ⓒ 1 clock cycle later DReady is reset to a logic high, and FError is evaluated. A logic high on FError indicates an invalid stop bit was received, a framing error. A logic high on PError indicates a parity error.

Description

The HD-6408 is a CMOS/LSI Manchester Encoder/Decoder for creating a very high speed asynchronous serial data bus. The Encoder converts serial NRZ data (typically from a shift register) to Manchester II encoded data adding a sync pulse and parity bit. The Decoder recognizes this sync pulse and identifies it as a Command Sync or a Data Sync. The data is then decoded and shifted out in the NRZ code (typically into a shift register). Finally, the parity bit is checked. If there were no Manchester or parity errors the Decoder responds with a valid word signal. This Decoder puts the Manchester code to full use to provide clock recovery and excellent noise immunity at these very high speeds.

The HD-6408 can be used in many commercial applications such as, security systems, environmental control systems, serial data links and many others. It utilizes a single 12X clock and achieves data rates of up to one million bits per second with a very minimum overhead of only 4 bits out of 20, leaving 16 bits for data.

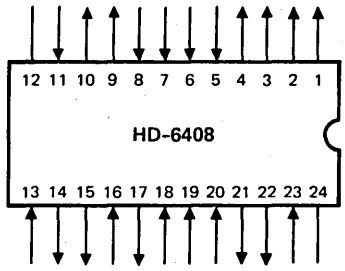
PIN	SYMBOL	SECTION	DESCRIPTION
1	VW	Decoder	Output high indicates receipt of a VALID WORD.
2	ESC	Encoder	ENCODER SHIFT CLOCK is an output for shifting data into the Encoder. This clock shifts data on a low-to-high transition.
3	TD	Decoder	TAKE DATA output is high during receipt of data after identification of a sync pulse.
4	SDO	Decoder	SERIAL DATA OUT delivers received data in correct NRZ format.
5	DC	Decoder	DECODER CLOCK input drives the transition finder, and the synchronizer which in turn supplies the clock to the balance of the Decoder.
6	BZI	Decoder	A high input should be applied to BIPOLAR ZERO IN when the bus is in its negative state. This pin must be held high when the Unipolar input is used.
7	BOI	Decoder	A high input should be applied to BIPOLAR ONE IN when the bus is in its positive state, this pin must be held low when the Unipolar input is used.
8	UDI	Decoder	With pin 6 high and pin 7 low, this pin enters UNIPOLAR DATA IN to the transition finder circuit. If not used this input must be held low.
9	DSC	Decoder	DECODER SHIFT CLOCK output delivers a frequency (DECODER CLOCK ÷ 12), synchronized by the recovered serial data stream.
10	CDS	Decoder	COMMAND/DATA SYNC output high occurs during output of decoded data which was preceded by a Command synchronizing character. A low output indicates a Data synchronizing character.
11	DR	Decoder	A high input to DECODER RESET during a rising edge of DECODER SHIFT CLOCK resets the decoder bit counting logic to a condition ready for a new word.
12	GND	Both	GROUND supply pin.



PIN	SYMBOL	SECTION	DESCRIPTION
13	MR	Both	A high on MASTER RESET clears the 2:1 counters in both the encoder and decoder and the ÷ 12 counter.
14	DBS	Encoder	DIVIDE BY SIX is an output from 6:1 divider which is driven by the ENCODER CLOCK.
15	$\overline{BZO}$	Encoder	$\overline{BIPOLAR\ ZERO\ OUT}$ is an active low output designed to drive the zero or negative sense of a bipolar line driver.
16	$\overline{OI}$	Encoder	A low on $\overline{OUTPUT\ INHIBIT}$ forces pin 15 and 17 high, their inactive states.
17	$\overline{BOO}$	Encoder	$\overline{BIPOLAR\ ONE\ OUT}$ is an active low output designed to drive the one or positive sense of a bipolar line driver.
18	SDI	Encoder	SERIAL DATA IN accepts a serial data stream at a data rate equal to ENCODER SHIFT CLOCK.
19	EE	Encoder	A high on ENCODER ENABLE initiates the encode cycle. (Subject to the preceding cycle being complete.)
20	SS	Encoder	SYNC SELECT actuates a Command sync for an input high and Data sync for an input low.
21	SD	Encoder	SEND DATA is an active high output which enables the external source of serial data.
22	SCI	Encoder	SEND CLOCK IN is 2X the Encoder data rate.
23	EC	Encoder	ENCODER CLOCK is the input to the 6:1 divider.
24	VCC	Both	Positive supply pin.

© IC MASTER 1983

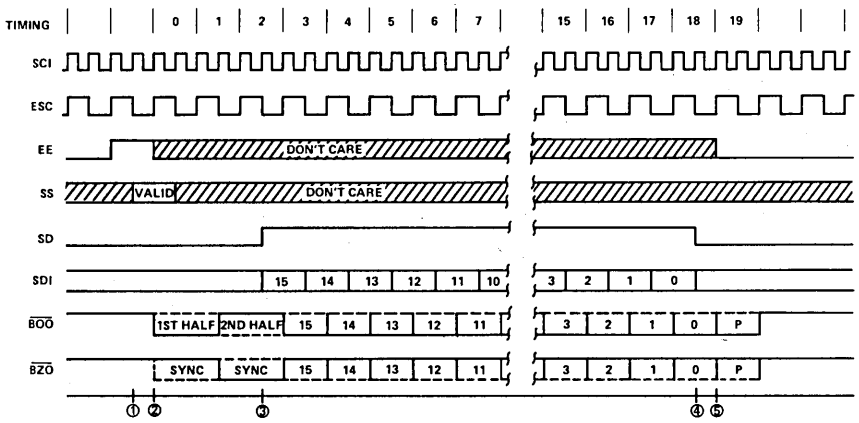
Encoder Operation

The Encoder requires a single clock with a frequency of twice the desired data rate applied at the SClock input. An auxiliary divide by six counter is provided on chip which can be utilized to produce the SClock by dividing the DClock.

The Encoder's cycle begins when EE is high during a falling edge of ESC (1). This cycle lasts for one word length or twenty ESC periods. At the next low-to-high transition of the ESC, a high at SS input actuates a Command sync or a low will produce a Data sync for that word (2). When the Encoder is ready to accept data, the SD output will go high and remain high for sixteen ESC periods (3) – (4).

During these sixteen periods the data should be clocked into the SDInput with every high-to-low transition of the ESC (3) – (4). After the sync and Manchester II encoded data are transmitted through the $\overline{BOO}$ and $\overline{BZO}$ outputs, the Encoder adds on an additional bit which is the (odd) parity for that word (5). At any time a low on $\overline{OI}$ will force both bipolar outputs to a high state but will not affect the Encoder in any other way.

To abort the Encoder transmission a positive pulse must be applied at MR. Any time after or during this pulse, a low-to-high transition on SCI clears the internal counters an initializes the Encoder for a new word.



Decoder Operation

The Decoder requires a single clock with a frequency of 12 times the desired data rate applied at the DClock input. The Manchester II coded data can be presented to the Decoder in one of two ways. The BOI and BZI inputs will accept data from a differential output comparator. The UDI input can only accept noninverted Manchester II coded data (e.g. from $\overline{BZO}$ of an Encoder).

The Decoder is free running and continuously monitors its data input lines for a valid sync character and two valid Manchester data bits to start an output cycle. When a valid sync is recognized (1), the type of sync is indicated by the CDS output. If the sync character was a command, this output will go high (2) and remain high for sixteen DSC periods (3), otherwise it will remain low. The TD output will go high and remain high (2) – (3) while the Decoder is transmitting the decoded data through SDO

The decoded data available at SDO is in a NRZ format. The DSC is provided so that the decoded bits can get shifted into an external register on every low-to-high transition for this clock (2) – (3).

After all sixteen decoded bits have been transmitted (3) the data is checked for odd parity. A high on VW output (4) indicates a successful reception of a word without any Manchester or parity errors. At this time the Decoder is looking for a new sync character to start another output sequence.

At any time in the above sequence a high input on DR during a low-to-high transition of DSC will abort transmission and initialize the Decoder to start looking for a new sync character.

- INDUSTRIAL OR MILITARY TEMPERATURE RANGE
- 20 PIN PACKAGE

Description

The HD-6409 Manchester Encoder-Decoder (MED) is a high speed, low power device manufactured using self-aligned silicon gate technology. The device is intended for use in serial data communication, and can be operated in either of two modes. In the converter mode, the MED converts Nonreturn-to-Zero code (NRZ) into Manchester code and decodes Manchester code into Nonreturn-to-Zero code. For serial data communication, Manchester code does not have some of the deficiencies inherent in Nonreturn-to-Zero code. For instance, use of the MED on a serial line eliminates DC components, provides clock recovery, and gives a relatively high degree of noise immunity. Because the MED converts the most commonly used code (NRZ) to Manchester code, the advantages of using Manchester code are easily realized in a serial data link.

In the Repeater mode, the MED accepts Manchester code input and reconstructs it with a recovered clock. This minimizes the effects of noise on a serial data link. A digital phase lock loop generates the recovered clock. A maximum data rate of 1MHz requires only 50mW of power.

Manchester code is used in magnetic tape recording and in fiber optic communication, and generally is used where data accuracy is imperative. Because it frames blocks of data, the HD-6409 easily interfaces to protocol controllers.

PIN	MNEMONIC NAME		DESCRIPTION
1 (I)	BZI	Bipolar Zero Input	Used in conjunction with pin 2, Bipolar One Input (BOI), to input Manchester II encoded data to the decoder. BZI and BOI are logical complements. When using pin 3, Unipolar Data Input (UDI) for data input, BZI must be held high.
2 (I)	BOI	Bipolar One Input	Used in conjunction with pin 1, Bipolar Zero Input (BZI), to input Manchester II encoded data to the decoder. BOI and BZI are logical complements. When using pin 3, Unipolar Data Input (UDI) for data input, BOI must be held low.
3 (I)	UDI	Unipolar Data Input	An alternate to bipolar input (BZI, BOI), Unipolar Data Input (UDI) is used to input Manchester II encoded data to the decoder. When using pin 1 (BZI) and pin 2 (BOI) for data input, UDI must be held low.
4 (I/O)	SD/CDS	Serial Data/Command Data Sync	In the converter mode, SD/CDS is an input used to receive serial NRZ data. NRZ data is accepted synchronously on the falling edge of encoder clock output (ECLK). In the repeater mode, SD/CDS is an output indicating the status of last valid sync pattern received. A high indicates a command sync and a low indicates a data sync pattern.
5 (O)	SDO	Serial Data Out	The decoded serial NRZ data is transmitted out synchronously with the decoder clock (DCLK). SDO is forced low when $\overline{RST}$ is low.
6 (O)	$\overline{SRST}$	$\overline{\text{Serial Reset}}$	In the converter mode, $\overline{SRST}$ follows $\overline{RST}$. In the repeater mode, when $\overline{RST}$ goes low, $\overline{SRST}$ goes low and remains low after $\overline{RST}$ goes high. $\overline{SRST}$ goes high only when $\overline{RST}$ is high, the reset bit is zero, and a valid synchronization sequence is received.
7 (O)	$\overline{NVM}$	$\overline{\text{Nonvalid Manchester}}$	A low on $\overline{NVM}$ indicates that the decoder has received invalid Manchester data and present data on Serial Data Out (SDO) is invalid. A high indicates that the sync pulse and data were valid and SDO is valid. $\overline{NVM}$ is set low by a low on $\overline{RST}$, and remains low after $\overline{RST}$ goes high until valid sync pulse followed by two valid Manchester bits is received.
8 (O)	DCLK	Decoder Clock	The decoder clock is a 1X clock recovered from BZI and BOI to synchronously output received NRZ data (SDO).
9 (I)	$\overline{RST}$	$\overline{\text{Reset}}$	In the converter mode, a low on $\overline{RST}$ forces SDO, DCLK, $\overline{NVM}$, and $\overline{SRST}$ low. A high on $\overline{RST}$ enables SDO and DCLK, and forces $\overline{SRST}$ high. $\overline{NVM}$ remains low after $\overline{RST}$ goes high until a valid sync pulse followed by two Manchester bits is received, after which it goes high. In the repeater mode, $\overline{RST}$ has the same effect on SDO, DCLK and $\overline{NVM}$ as in the converter mode. When $\overline{RST}$ goes low, $\overline{SRST}$ goes low and remains low after $\overline{RST}$ goes high. $\overline{SRST}$ goes high only when $\overline{RST}$ is high, the reset bit is zero and a valid synchronization sequence is received.

(I) - Input

(O) - Output

© IC MASTER 1983

PIN	MNEMONIC NAME		DESCRIPTION
10 (I)	GND	Ground	Ground
11 (O)	Co	Clock Output	Buffered output of clock input Ix. May be used as clock signal for other peripherals.
12 (I)	Ix	Clock Input	Ix is the input for an external clock or, if the internal oscillator is used, Ix and Ox are used for the connection of the crystal.
13 (I)	Ox	Clock Drive	If the internal oscillator is used, Ox and Ix are used for the connection of the crystal.
14 (I)	MS	Mode Select	MS must be held low for operation in the converter mode, and high for operation in the repeater mode.
15 (I)	$\overline{CTS}$	Clear to Send	In the converter mode, a high disables the encoder, forcing outputs $\overline{BOO}$, $\overline{BZO}$ high and ECLK low. A high to low transition of $\overline{CTS}$ initiates transmission of a Command sync pulse. A low on $\overline{CTS}$ enables $\overline{BOO}$, $\overline{BZO}$, and ECLK. In the repeater mode, the function of $\overline{CTS}$ is identical to that of the converter mode with the exception that a transition of $\overline{CTS}$ does not initiate a synchronization sequence.
16 (O)	ECLK	Encoder Clock	In the converter mode, ECLK is a 1X clock output used to receive serial NRZ data to SD/CDS. In the repeater mode, ECLK is a 2X clock which is recovered from BZI and BOI data by the digital phase locked loop.
17 (I)	SS	Speed Select	A logic high on SS sets the data rate at 1/32 times the clock frequency while a low sets the data rate at 1/16 times the clock frequency.
18 (O)	$\overline{BZO}$	$\overline{\text{Bipolar Zero Output}}$	$\overline{BZO}$ and its logical complement $\overline{BOO}$ are the Manchester data outputs of the encoder. The inactive state for these outputs is in the high state.
19 (0)	$\overline{BOO}$	$\overline{\text{Bipolar One Out}}$	see pin 18
20 (I)	V_{CC}	V_{CC}	Positive Power Supply

ENCODER OPERATION

The encoder uses free running clocks at 1X and 2X the data rate derived from the system clock I_X for internal timing. $\overline{CTS}$ is used to control the encoder outputs, ECLK, $\overline{BOO}$ and $\overline{BZO}$. A free running 1X ECLK is transmitted out of the encoder to drive the external circuits which supply the NRZ data to the MED at pin SD/CDS.

A low on $\overline{CTS}$ enables encoder outputs ECLK, $\overline{BOO}$ and $\overline{BZO}$, while a high on $\overline{CTS}$ forces $\overline{BZO}$, $\overline{BOO}$ high and holds ECLK low. When $\overline{CTS}$ goes from high to low ①, a synchronization sequence is transmitted out on $\overline{BOO}$ and $\overline{BZO}$. A synchronization sequence consists of eight Manchester "0" bits followed by a command sync pulse. ② A command sync pulse is a three bit wide pulse with the first 1½ bits high followed by 1½ bits low. ③ Serial NRZ data is clocked into the encoder at SD/CDS on the high to low transition of ECLK during the command sync pulse. The NRZ data received is encoded into Manchester II data and transmitted out on $\overline{BOO}$ and $\overline{BZO}$ following the command sync pulse. ④ Following the synchronization sequence, input data is encoded and transmitted out continuously without parity check or word framing. The length of the data block encoded is defined by $\overline{CTS}$. Manchester data out is inverted.

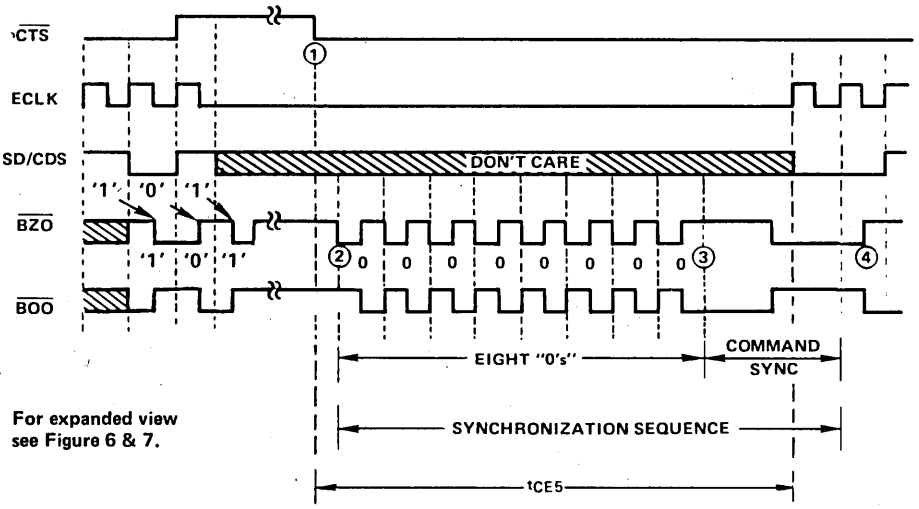

FIGURE 1

DECODER OPERATION

The decoder requires a single clock with a frequency 16X or 32X the desired data rate. The rate is selected on the speed select with SS low producing a 16X clock and high a 32X clock. For long data links the 32X mode should be used as this permits a wider timing jitter margin. The internal operation of the decoder utilizes a free running clock synchronized with incoming data for its clocking.

The Manchester II encoded data can be presented to the decoder in either of two ways. The Bipolar One and Bipolar Zero inputs will accept data from differential inputs such as a comparator sensed transformer coupled bus. The Unipolar Data input can only accept noninverted Manchester II encoded data, i.e. Bipolar Zero Out of an encoder. The decoder continuously monitors this data input for a valid sync pattern. Note that while the MED encoder section can generate only a command sync pattern, the decoder can recognize either a command or data sync pattern. A data sync is a logically inverted command sync.

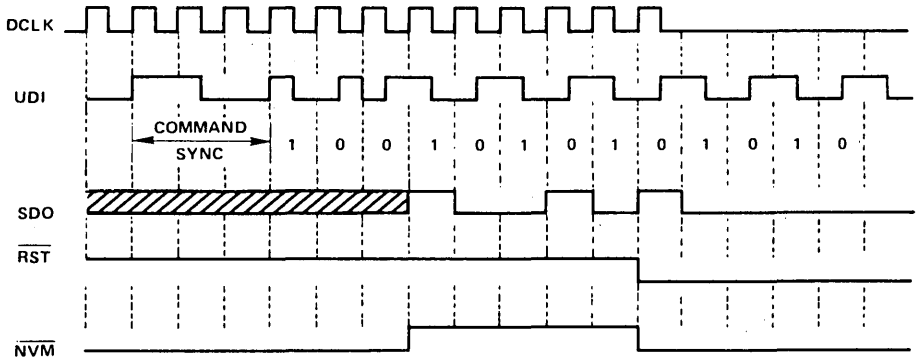
There is a three bit delay between UDI, BOI or BZI input and the decoded NRZ data transmitted out of SDO.

Control of the decoder outputs is provided by the $\overline{RST}$ pin. When $\overline{RST}$ is low, SDO, DCLK and $\overline{NVM}$ are forced low. When $\overline{RST}$ is high, SDO is transmitted out synchronously with the recovered clock DCLK. The $\overline{NVM}$ output remains low after a low to high transition on $\overline{RST}$ until a valid sync pattern is received.

The decoded data at SDO is in NRZ format. DCLK is provided so that the decoded bits can be shifted into an external register on every high to low transition of this clock.

Three bit periods after an invalid Manchester bit is received on UDI, or BOI and BZI, $\overline{NVM}$ goes low synchronously with the questionable data output on SDO. Further, the decoder does not reestablish proper data decoding until another sync pattern is recognized.

© IC MASTER 1983



For expanded view see Figure 8.

FIGURE 2

Repeater Mode

Manchester II data can be presented to the repeater in either of two ways. The inputs Bipolar One In and Bipolar Zero In will accept data from differential inputs such as a comparator or sensed transformer coupled bus. The input Unipolar Data In accepts only non-inverted Manchester II coded data. The decoder requires a single clock with a frequency 16X or 32X the desired data rate. This clock is selected to 16X with Speed Select low and 32X with Speed Select high. For long data links the 32X mode should be used as this permits a wider timing jitter margin.

The inputs UDI, or BOI, BZI are delayed approximately 1/2 bit period and repeated as outputs $\overline{BOO}$ and $\overline{BZO}$. The 2X ECLK is transmitted out of the repeater synchronously with $\overline{BOO}$ and $\overline{BZO}$.

A low on $\overline{CTS}$ enables ECLK, $\overline{BOO}$, and $\overline{BZO}$. In contrast to the converter mode, a transition on $\overline{CTS}$ does not initiate a synchronization sequence of eight 0's and a command sync. The repeater mode does recognize a command or data sync pulse. SD/CDS is an output which reflects the state of the most recent sync pulse received, with high indicating a command sync and low indicating a data sync.

When $\overline{RST}$ is low, the outputs SDO, DCLK, and $\overline{NVM}$ are low, and $\overline{SRST}$ is set low. $\overline{SRST}$ remains low after $\overline{RST}$ goes high and is not reset until a sync pulse and two valid manchester bits are received with the reset bit low. With $\overline{RST}$ high, NRZ Data is transmitted out of Serial Data Out synchronously with the 1X DCLK.

MANCHESTER CODE

Nonreturn to Zero (NRZ) code represents the binary values logic-0 and logic-1 with a static level maintained throughout the data cell. In contrast, Manchester code represents data with a level transition in the middle of the data cell. Manchester has bandwidth, error detection, and synchronization advantages over NRZ code.

The Manchester II code Bipolar One and Bipolar Zero shown below are logical complements. The direction of the transition indicates the binary value of data. A logic-0 in Bipolar One is defined as a low to high transition in the middle of the data cell, and a logic-1 as a high to low mid bit transition. Manchester I code is not properly decoded by the HD-6409. Manchester II is also known as Biphase-L code.

The bandwidth of NRZ is from DC to the clock frequency fc/2, while that of Manchester is from fc/2 to fc. Thus, Manchester can be AC or transformer coupled, which has considerable advantages over DC coupling. Also, the ratio of maximum to minimum frequency of Manchester extends one octave, while the ratio for NRZ is the range of 5-10 octaves. It is much easier to design a narrow band than a wideband amp.

Secondly, the mid bit transition in each data cell provides the code with an effective error detection scheme. If noise produces a logic inversion in the data cell such that there is no transition, an error indiction is given, and synchronization must be re-established. This places relatively stringent requirements on the incoming data.

The synchronization advantages of using the HD-6409 and Manchester code are several fold. One is that Manchester is a self clocking code. The clock in serial data communication defines the position of each data cell. Non self clocking codes, as NRZ, often require and extra clock wire or clock track (in magnetic recording). Further, there can be a phase variation between the clock and data track. Crosstalk between the two may be a problem. In Manchester, the serial data stream contains both the clock and the data, with the position of the mid bit transition representing the clock, and the direction of the transition representing data. There is thus no phase variation between the clock and the data.

A second synchronization advantage is a result of the number of transitions in the data. The decoder resynchronizes on each transition, or at least once every data cell. In contrast, receivers using NRZ, which does not necessarily have transitions, must resynchronize on frame bit transitions, which occur far less often, usually on a character basis. This more frequent resynchronization eliminates the cumulative effect of errors over sucessive data cells. A final synchronization advantage concerns the HD-6409's sync pulse used to initiate synchronization. This three bit wide pattern is sufficiently distinct from Manchester data that a false start by the receiver is unlikely.

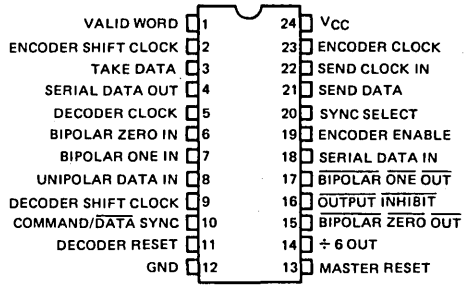
- MANCHESTER II ENCODE, DECODE
- SEPARATE ENCODE AND DECODE
- LOW OPERATING POWER: 50mW AT 5 VOLTS
- FULL MILITARY TEMPERATURE RANGE

Pinout



Description

The Harris HD-15530 is a high performance CMOS device intended to service the requirements of MIL-STD-1553 and similar Manchester II encoded, time division multiplexed serial data protocals. This LSI chip is divided into two sections, an Encoder and a Decoder. These sections operate completely independent of each other, except for the Master Reset function.

This circuit meets many of the requirements of MIL-STD-1553. The Encoder produces the sync pulse and the parity bit as well as the encoding of the data bits. The Decoder recognizes the sync pulse and identifies it as well as decoding the data bits and checking parity.

This integrated circuit is fully guaranteed to support the 1MHz data rate of MIL-STD-1553 over both temperature and voltage. It interfaces with CMOS, TTL or N channel support circuitry, and uses a standard 5 volt supply.

The HD-15530 can also be used in many party line digital data communications applications, such as an environmental control system driven from a single twisted pair cable or fiber optic cable throughout the building.

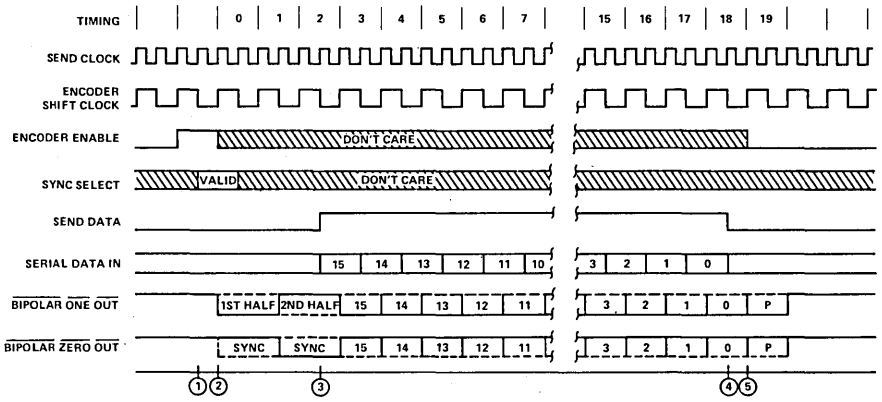
Encoder Operation

The Encoder requires a single clock with a frequency of twice the desired data rate applied at the SEND CLOCK input. An auxillary divide by six counter is provided on chip which can be utilized to produce the SEND CLOCK by dividing the DECODER CLOCK.

The Encoder's cycle begins when ENCODER ENABLE is high during a falling edge of ENCODER SHIFT CLOCK ①. This cycle lasts for one word length or twenty ENCODER SHIFT CLOCK periods. At the next low-to-high transition of the ENCODER SHIFT CLOCK, a high at SYNC SELECT input actuates a command sync or a low will produce a data sync for that word ② . When the Encoder is ready to accept data, the SEND DATA output will go high and remain high for sixteen ENCODER SHIFT CLOCK periods ③ . During these sixteen periods the data should be clocked into the SERIAL DATA input with every low-to-high transition of the ENCODER SHIFT CLOCK ③ – ④ . After the sync and the Manchester II coded data are transmitted through the $\overline{\text{BIPOLAR ONE}}$ and $\overline{\text{BIPOLAR ZERO}}$ outputs, the Encoder adds on an additional bit which is the parity for that word ⑤ . At any time a low on $\overline{\text{OUTPUT INHIBIT}}$ input will force both bipolar outputs to a high state but will not affect the Encoder in any other way.

To abort the Encoder transmission a positive pulse must be applied at MASTER RESET. Anytime after or during this pulse, a low to high transition on SEND CLOCK clears the internal counters and initializes the Encoder for a new word.



Decoder Operation

The Decoder requires a single clock with a frequency of 12 times the desired data rate applied at the DECODER CLOCK input. The Manchester II coded data can be presented to the Decoder in one of two ways. The BIPOLAR ONE and BIPOLAR ZERO inputs will accept data from a comparator sensed transformer coupled bus as specified in Military Spec 1553. The UNIPOLAR DATA input can only accept non-inverted Manchester II coded data. (e.g. from $\overline{\text{BIPOLAR ZERO OUT}}$ of an Encoder.)

The Decoder is free running and continuously monitors its data input lines for a valid sync character and two valid Manchester data bits to start an output cycle. When a valid sync is recognized ①, the type of sync is indicated on COMMAND/$\overline{\text{DATA}}$ SYNC output. If the sync character was a command sync, this output will go high ② and remain high for sixteen DECODER SHIFT CLOCK periods ③ , otherwise it will remain low. The TAKE DATA output will go high and remain high ② – ③ while the Decoder is transmitting the decoded data through SERIAL DATA OUT. The decoded data available at SERIAL DATA OUT is in a NRZ format. The DECODER SHIFT CLOCK is provided so that the decoded bits can get shifted into an external register on every low-to-high transition of this clock ② – ③ .

After all sixteen decoded bits have been transmitted ③ the data is checked for odd parity. A high on VALID WORD output ④ indicates a successful reception of a word without any Manchester or parity errors. At this time the Decoder is looking for a new sync character to start another output sequence.

At any time in the above sequence a high input on DECODER RESET during a low-to-high transition of DECODER SHIFT CLOCK will abort transmission and initialize the Decoder to start looking for a new sync character.

PIN	SECTION	NAME	DESCRIPTION
1	Decoder	VALID WORD	Output high indicates receipt of a valid word.
2	Encoder	ENCODER SHIFT CLOCK	Output for shifting data into the Encoder. This clock shifts data on a low-to-high transition.
3	Decoder	TAKE DATA	Output is high during receipt of data after identification fo a sync pulse.
4	Decoder	SERIAL DATA OUT	Delivers received data in correct NRZ format.
5	Decoder	DECODER CLOCK	Input drives the transition finder, and the synchronizer which in turn supplies the clock to the balance of the Decoder.
6	Decoder	BIPOLAR ZERO IN	A high input should be applied when the bus is in its negative state. This pin must be held high when the Unipolar input is used.
7	Decoder	BIPOLAR ONE IN	A high input should be applied when the bus is in its positive state, this pin must be held low when the Unipolar input is used.
8	Decoder	UNIPOLAR DATA IN	With pin 6 high and pin 7 low, this pin enters unipolar data into the transition finder circuit. If not used this input must be held low.
9	Decoder	DECODER SHIFT CLOCK	Output which delivers a frequency (Decoder Clock ÷ 12), synchronized by the recovered serial data stream.
10	Decoder	COMMAND SYNC	Output of a high from this pin occurs during output of decoded data which was preceded by a Command (or Status) synchronizing character. A low output indicates a Data synchronizing character.
11	Decoder	DECODER RESET	A high input to this pin during a rising edge of DECODER SHIFT CLOCK resets the decoder bit counting logic to a condition ready for a new word.
12	Both	GROUND	Ground supply pin.
13	Both	MASTER RESET	A high on this pin clears 2:1 counters in both the Encoder and Decoder.
14	Encoder	÷ 6 OUT	Output from 6:1 divider which is driven by the ENCODER CLOCK.
15	Encoder	$\overline{\text{BIPOLAR ZERO OUT}}$	An active low output designed to drive the zero or negative sense of a bipolar line driver.
16	Encoder	$\overline{\text{OUTPUT INHIBIT}}$	A low on this input forces pin 15 and pin 17 high, the inactive states.
17	Encoder	$\overline{\text{BIPOLAR ONE OUT}}$	An active low output designed to drive the one or positive sense of a bipolar line driver.
18	Encoder	SERIAL DATA IN	Accepts a serial data stream at a data rate equal to ENCODER SHIFT CLOCK.
19	Encoder	ENCODER ENABLE	A high on this input initiates the encode cycle. (Subject to the preceding cycle being complete.)
20	Encoder	SYNC SELECT	Actuates command sync for an input high and data sync for an input low.
21	Encoder	SEND DATA	Is an active high output which enables the external source of serial data.
22	Encoder	SEND CLOCK IN	Clock input at a frequency equal to the data rate X2.
23	Encoder	ENCODER	Input to the 6:1 divider.
24	Both	V_{CC}	Positive supply pin.

Description

The Harris HD-15531 is a high performance CMOS device intended to service the requirements of MIL-STD-1553 and similar Manchester II encoded, time division multiplexed serial data protocals. This LSI chip is divided into two sections, an Encoder and a Decoder. These sections operate independently of each other, except for the Master Reset and frame length functions.

This circuit provides many of the requirements of MIL-STD-1553. The Encoder produces the sync pulse and the parity bit as well as the encoding of the data bits. The Decoder recognizes the sync pulse and identifies it as well as decoding the data bits and checking parity.

The HD-15531 also surpasses the requirements of MIL-STD-1553 by allowing the frame length to be programmable. The frame length may be programmed from 2 to 28 data bits plus sync and parity. This chip also allows selection of either even or odd parity for the Encoder and Decoder separately.

This integrated circuit is fully guaranteed to support the 1MHz data rate of MIL-STD-1553 over both temperature and voltage. It interfaces with CMOS, TTL or N channel support circuitry, and uses a standard 5 volt supply.

The HD-15531 can also be used in many party line digital data communications applications, such as an environmental control system driven from a single twisted pair of fiber optic cable throughout a building.

Description

The Harris HD-15531B Programmable Manchester Encoder-Decoder (MED) is intended to be used as a high speed, low power, serial data link controller in applications where data integrity combined with low overhead is important. It is manufactured using Harris' Self Aligned Junction Isolated (SAJI) CMOS process.

This LSI chip is divided into two sections, an encoder and a decoder. These sections operate independently of each other except for the Master Reset and frame length select function. In addition to encoding/decoding of NRZ data the HD-15531B frames variable length data (2-28 bits) with one of two types of synchronization characters and a parity bit. Independent selection of even or odd parity for the encoder and decoder is included.

An internal error detection algorithm will detect all single, double or triple sampling errors. In addition, this algorithm will typically detect better than 99% of four or more errors in any one word.

Ideal applications include party line Local Area Networks as well as data acquisition systems where 8, 12 or 16 bit A/D converters are typically used for the digital transmission of data.

HERE ARE 9 COMPELLING REASONS FOR HAVING US PRODUCE A CUSTOM LSI CIRCUIT FOR YOU:

1. The money you'll save. Production cost will be lower since you'll only be wiring in one chip instead of many. And you'll save money on quality control, inventory, and in-plant handling.

2. The improved reliability of your product.

3. Proprietary protection: a custom circuit is almost impossible to copy.

4. Enhanced marketability: extra functions not included in original chip concept can be loaded on the chip—usually at no extra cost—enabling product to do things it never could before.

5. At LSI Computer Systems, Inc., your chip receives full-time attention by experts, whatever the size of your order.

6. It is produced on the finest most advanced processing equipment, with the MOS technique best suited to your requirements.

7. Each chip receives 100% functional testing.

8. The "prototypes" you receive for your verification are random samples from an actual production run, not products of a special prototype line.

9. LSI Computer Systems, Inc., has been helping companies large and small realize the full benefits of MOS/LSI circuits for over ten years. All of its engineers have been involved with MOS since its infancy.

AND HERE ARE 23 HOTSHOT STANDARD CIRCUITS FOR YOU TO USE RIGHT NOW:

INTEGRATED CONTROLLER-SEQUENCER (ICS)

The first microprocessor designed specifically for logical sequencing, timing, and controlling functions; where simple decision-making, as opposed to computation is of prime importance. It is far more easily programmable than any other μP, and program can be stored in any standard ROM, PROM, EEPROM, EAROM, or RAM. Low-cost, reliable replacement for hard-wired controls and relay networks.

PROGRAMMABLE DIGITAL DELAY TIMER

For delaying the starting or stopping of an operation.

LS7210: Can generate delay, flashing, ms to infinity, or add auto reset to μP system, programmed by 5 binary weighted input bits plus on chip oscillator or external clock. Operable in 4 modes: delayed operate or release, dual delay, or one-shot. Ion-planted PMOS; all inputs CMOS, PMOS, & TTL compatible. 14-pin DIP.

CMOS DIVIDERS

For generating time bases from 50/60 Hz input. All feature: input shaping network; resettable; division select input 50/60 Hz; clock enable input; 8-pin mini-DIP — inputs arranged so that circuit cannot be damaged if plugged in backwards.
RED 5/6: 10 pulses/sec. RED 50/60: 1 pulse/sec. RED 3000/3600: 1 pulse/minute. RED 100/120: 1 pulse/2 seconds. RED 300/360: 1 pulse/0.1 minute.

For generating decade-related time bases.

RDD104XTL: 8-pin mini-DIP addressable divider divides by 10^1, 10^2, 10^3, 10^4. Input may be controlled by crystal or external frequency source.
RDD104RC: RC oscillator version of above.

DIGITAL LOCK CIRCUITS

For automotive/marine anti-theft.

LS7220: 14-pin DIP; 5,040 4-digit combinations; out-of-sequence detection logic; 25μA standby; "Save" mode for valet parking, settable in "Unlock"; built-in convenience delay.

For area access and machine access.

LS7225: 14-pin DIP; 5,040 4-digit combinations; toggle output (set and reset with application of code); momentary output; tamper output.

For serial address decoding or 2-pushbutton keyless locks.

LS7229: Address decoder/digital lock. 16-pin DIP. Code programmable through 9 parallel pins. Serial decoding input can be applied through dual pulse train or two pushbuttons. Pulse output. Duration between entries capacitor programmable. Cascadable.

MOTOR SPEED CONTROLLERS

LS7263: Crystal controlled 3-phase motor speed controller. For motor speed of 3600 rpm, accuracy of .01% achieved within 20 seconds.
LS7262: Same as LS7263, but for 2-phase motor.

DISPLAY DRIVERS

For liquid crystal displays requiring up to 60V.

LS7100: BCD to 7 segment latch/decoder/driver.
LS7110: Binary addressable latched 8-channel demultiplexer/driver. Both are ion-implanted P Channel MOS circuits, compatible with CMOS and TTL systems. 16-pin DIPS.

LSI COMPUTER SYSTEMS INC. Since 1969
Manufacturers of Custom and Standard LSI circuits.
1235 Walt Whitman Rd., Melville, NY 11747
(516) 271-0400. TWX: 510 226-7833.

COUNTERS

DC to 5 MHz: LS7030: DC to 5 MHz eight decade MOS up counter with 8 decade latch and multiplexer. Multiplexed BCD and 7 segment outputs. Single power supply +4.75 to +15 VDC (full frequency range over full voltage range). Compatible with CMOS logic. Counter output latches. Leading zero blanking. 40-pin DIP.

5 MHz to 500 MHz: LS7031: DC to 5 MHz six decade MOS up counter with 8 decade latch and multiplexer. Multiplexed BCD outputs. Access to LSD latches allows attachment of prescalers for counting to 500 MHz. Leading zero blanking. Single power supply operation +4.75 to +15 VDC (full frequency range over full voltage range). Compatible with CMOS logic. 40-pin DIP.

For multi-comparison applications where parallel outputs are required.

LS7040: Dual 3 decade up/down counter with parallel BCD outputs. DC to 350 KHz count frequency at +5 volts. Fully synchronous operation. Inputs CMOS, TTL, and DTL compatible at +5V operation. Reset. Count enable. Power-on-reset. 40-pin DIP.
LS7240: 7-level comparator/multiplexer with parallel BCD inputs, for use with LS7040.

For counting applications requiring presignalling and recycling.

LS7055: DC to 250 KHz six decade up/down counter with integral preset, presignal, and main signal store. Automatic or manual preset/reset control. Three comparators with output flags. Multiplexed BCD and 7 segment outputs. Internal oscillator. Single power supply operation +5 to +15 volts. High noise immunity. All inputs CMOS compatible over entire power range. 40-pin DIP. (Successor to LS7050).

DC to 10 MHz: LS7060: DC to 10 MHz 32-bit MOS binary counter with 32-bit latch and multiplexer. 8-bit tri-state multiplexed outputs. Single power supply +4.75 to +5.25 VDC. **Bus compatible.** 18-pin DIP.
LS7062: Identical, except that it is a **dual 16-bit counter,** with two inputs.

DC to 2.56 GHz: LS7061: DC to 10 MHz 32-bit MOS up counter with 40-bit latch and multiplexer. 8-bit tri-state multiplexed outputs. Access to 8 LSB latches allows attachment of prescalers for counting to 2.56 GHz. Single power supply operation +4.75 to +5.25 VDC. **Bus compatible.** 24-pin DIP.

Description

This family of ISO-CMOS, MSI circuits is designed for use in high speed memory and peripheral, address decoding systems. MD54/74SC138 and MD54/74SC238, decode 3 binary inputs (A_0, A_1, A_2) to select one of eight mutually exclusive outputs (0_0 - 0_7). Three enable inputs, two active LOW ($\overline{E}_1$, $\overline{E}_2$) and one active HIGH (E_3), reduce the need for external gates in an expanded system. MD54/74SC137 and MD54/74SC237 feature additional latches on A_0, A_1 and A_2 for use in glitch free applications. When Latch Enable (LE) is LOW the device acts as MD54/74SC138. When LE is HIGH the address present at A_0 to A_2 is stored. A 1 to 32 decoder requires only four of these devices and one inverter. MD54/74SC139 and MD54/74SC239 feature two individual, two line (A_O-A_1) to four line (0_O-0_3) decoders.

Device Selection

Product	Format	Output
MD54/74SC137	1 of 8, latched address	inverted
MD54/74SC138	1 of 8	inverted
MD54/74SC139	Dual 1 of 4	inverted
MD54/74SC237	1 of 8, latched address	non-inverted
MD54/74SC238	1 of 8	non-inverted
MD54/74SC239	Dual 1 of 4	non-inverted

Description

This family of ISO-CMOS Octal Buffers and Line Drivers are designed to improve P.C. board density and performance in three-state memory address drivers, clock drivers and bus oriented receivers and transmitters. A comprehensive range of devices, cover a selection of differing input/output pin layouts, inverting and non-inverting buffers and a choice of similar or complementary, output controls ($\bar{E}_A$, $\bar{E}_B$).

Device Selection

PRODUCT	3-STATE CONTROL	DATA OUTPUTS

ISO-CMOS Octal Bus Transceivers with 3-State Buffered Outputs

MD54SC245, MD54SC545
MD74SC245, MD74SC545

OCT '82

Features

- Pin compatible with 54/74LS245 types
- Low power ISO-CMOS technology
- Short propagation delay
- Bus oriented 3-state outputs
- CMOS inputs reduce DC loading
- Fully TTL compatible, inputs and outputs

Ordering Information

MD54SCXXXAC	20 Pin, Cerdip
MD74SCXXXAC	20 Pin, Cerdip
MD74SCXXXAE	20 Pin, Plastic DIP

Description

These octal bus transceiver circuits are designed for high-speed asynchronous two-way communication between data buses. The control function inputs minimize external timing requirements.

The devices provide data transmission from the A bus to the B bus or from the B bus to the A bus depending upon the logic level at the direction control input (DIR) pin. The enable input ($\overline{G}$) pin can be used to disable the device outputs so that the buses are effectively isolated from each other. The MD54/74SC545 differs from the MD54/74SC245 by use of inverting buffers.

Device Selection

Product	Format	Output
MD54/74SC245	Bi-directional Buffer	non-inverted
MD54/74SC545	Bi-directional Buffer	inverted

Description

This family of 8 bit latches feature 3-state operation and are designed for use in high speed, bus oriented, systems. The '373 appears transparent to data (outputs change asynchronously) when Latch Enable, LE, is HIGH. When LE is LOW, data meeting the set up times becomes latched. The '374 latches hold their individual data when meeting set up times with the clock, CK, LOW-to-HIGH transition. With both devices $\overline{OE}$ does not affect the state of the latches, but when $\overline{OE}$ is HIGH the output is put into high impedence. Data may thus be latched even when the device is deselected. A selection of packages offers a choice of inverted or non-inverted outputs.

Device Selection

Product	Format	Output
MD54/74SC373	transparent latch	non-inverted
MD54/74SC374	D type flip-flop	non-inverted
MD54/74SC533	transparent latch	inverted

16x16 Multiplier/Divider
SN54/74S516

Features/Benefits

- **Co-processor for enhancing the arithmetic speed of all present 16-bit and 8-bit microprocessors**
- **Bus-oriented organization**
- **24-pin package**
- **16/16 or 32/16 division in less than 3.5 μsec**
- **16x16 multiplication in less than 1.5 μsec**
- **28 different multiplication instructions such as "fractional multiply and accumulate"**
- **13 different divide instructions**
- **Self-contained and microprogrammable**

Description

The SN54/74S516 ('S516) is a bus-organized 16x16 Multiplier/Divider. The device provides both multiplication and division of 2s-complement 16-bit numbers at high speed. There are 28 different multiply options, including: positive and negative multiply, positive and negative accumulation, multiplication by a constant, and both single-length and double-length addition in conjunction with multiplication. 13 different divide options allow single-length or double-length division, division of a previously-generated result, division by a constant, and continued division of a remainder or quotient.

The 'S516 is a time-sequenced device requiring a single clock. It loads operands from, and presents results to, a bidirectional 16-bit bus. Loading of the operands, reading of the results, and sequential control of the device is performed by a 3-bit instruction field.

The 'S516 has the additional feature that operands and results can be either integers or fractions; when it deals with fractions, automatic scaling occurs. Results can be rounded if required, and an Overflow output indicates whenever a result is outside the normally-accepted number range.

For a simple multiplication of two operands the device takes nine clock periods — one for initialization, and eight for the actual multiplication. A realistic clock period is 167 ns, which gives a multiplication time of 1333 ns typical for 16x16 multiplication, plus 167 ns additionally for initialization, or 1500 ns in all. More complex multiplications will take additional clock periods for loading the additional operands. A simple division operation requires 16 + 4 = 20 clock periods for a typical time of 3.333 ns (16 bits/8 bits), also plus 167 ns for initialization, or 3500 ns in all.

	5	7	7	Round, then Read Z, W	3

NOTES:
1. X,Y are input multiplier and multiplicand.
2. X1 is the previous contents of the first rank of the X register (either the old X or a new X).
3. Fractional or integer arithmetic is specified by having the next-to-the-last operand loaded using a 5 or 6 instruction respectively. All rows beginning with "5/6" in effect represent *two* instructions. 5 does fractional arithmetic and 6 does integer arithmetic.
4. Z, W is a double-precision number. Z is the most significant half, Z, W represents addend upon input, and product (or accumulated sum) after multiplication.
5. K_Z, K_W represents previous accumulator contents. K_Z is the most-significant half.
6. W_{sign} is a single-length signed number, with sign extension.
7. Maximum clock cycle = 125 ns for an 8-MHz clock.
8. If n instruction codes are shown at the left under "instruction sequences," the number of clock cycles at the right is n+8 for multiplication and n+20 for division.
9. By presenting code 7 on the instruction lines at least one clock cycle before the last clock pulse of the operation cycles, the result (register Z) is available on the bus one clock earlier (see Figure 9).
10. The code "5/6 6 6 6" represents an incomplete operation since it leaves the 'S516 in state 1 rather than in state 0, 8, or 10.

Figure 1 'S516 Instruction Set (Partial List)

SUMMARY OF SIGNALS/PINS	
B_{15}-B_0	Bidirectional data bus inputs/outputs
I_2-I_0	Instruction (sequential control) input
CK	Clock pulse input
$\overline{GO}$	Chip activation input
OVR	Arithmetic overflow output

Description (continued)

The 'S516 device uses standard low-power Schottky technology, requires a single +5V power supply, and is fully TTL compatible. Bus inputs require at most 250 μA input current, and control and clock inputs require at most 1 mA input current. Bus outputs are three-state, and are capable of sinking 8 mA at the low logic level. The 'S516 is available in both commercial-temperature and military-temperature ranges, in a 600-mil 24-pin dual-in-line ceramic package.

Device Operation

The 'S516 contains four 16-bit working registers. Y is the multiplier register; X is the multiplicand and divisor register; W is the least-significant half of a double-length accumulator, and holds the least-significant half of the product after a multiplication operation, or the remainder after a division operation; and Z is the most-significant half of this same accumulator. In addition to these registers, there is a high-speed arithmetic unit which performs addition, subtraction, and shifting steps in order to accomplish the various arithmetic operations; a loading sequencer; and a PLA control network.

Operands are loaded into the working registers in time sequence at each clock period, under the control of this sequencer. The chip-activation signal $\overline{GO}$ must be LOW in order to begin the loading process and continue to the next step in the loading operation. If $\overline{GO}$ is continually held HIGH, the 'S516 remains in a wait state with its outputs held in their high-impedance states, so that the other devices attached to the bus may drive it. In this condition, the 'S516 does not respond to any codes on its instruction inputs; in effect, it does not "wake up" until $\overline{GO}$ goes LOW. Also, $\overline{GO}$ may change only when the clock input CK is HIGH. After all of the operands are loaded, the 'S516 jumps to the multiply routine, or to the divide routine, and performs the required operations as indicated in Figure 1. After 9 clock periods for a simple multiply or 21 clock periods for a simple divide, for example, the result is placed on the bus in time sequence.

8x8 High Speed Schottky Multipliers
SN54/74S557 SN54/74S558

Features/Benefits

- **Industry-standard 8x8 multiplier**
- **Multiplies two 8-bit numbers; gives 16-bit result**
- **Cascadable; 56x56 fully-parallel multiplication uses only 34 multipliers for the most-significant half of the product**
- **Full 8x8 multiply in 60ns worst case**
- **Three-state outputs for bus operation**
- **Transparent 16-bit latch in 'S557**
- **Plug-in compatible with original Monolithic Memories' 67558**

Description

The 'S557/'S558 is a high-speed 8x8 combinatorial multiplier which can multiply two eight-bit unsigned or signed twos-complement numbers and generate the sixteen-bit unsigned or signed product. Each input operand X and Y has an associated Mode control line, X_M and Y_M respectively. When a Mode control line is at a Low logic level the operand is treated as an unsigned eight-bit number, while if the Mode control is at a High logic level the operand is treated as an eight-bit signed twos-complement number. Additional inputs, R_S and R_U, (R, S557) allow the addition of a bit into the multiplier array at the appropriate bit positions for rounding signed or unsigned fractional numbers.

The 'S557 internally develops proper rounding for either signed or unsigned numbers by combining the rounding input R with X_M, Y_M, $\overline{X_M}$, and $\overline{Y_M}$ as follows:

$R_U = \overline{X_M} \cdot \overline{Y_M} \cdot R$ = Unsigned rounding input to 2^7 adder.

$R_S = (X_M + Y_M)\ R$ = Signed rounding input to 2^6 adder.

Since the 'S558 does not require the use of pin 11 for the latch enable input G, R_S and R_U are brought out separately.

The most-significant product bit is available in both true and complemented form to assist in expansion to larger signed multipliers. The product outputs are three-state, controlled by an assertive-low Output Enable which allows several multipliers to be connected to a parallel bus or be used in a pipelined system. The device uses a single +5V power supply and is packaged in a standard 40-pin DIP.

First-In First-Out (FIFO) 64x4 64x5 Serial Cascadable Memory

C67401/B C67402B
C5/C67401/A C5/C67402A
C5/C67401 C5/C67402

Features/Benefits

- Choice of 16.7, 15, and 10 MHz shift out guaranteed rates
- Choice of 4 bit or 5 bit data width
- TTL inputs and outputs
- Readily expandable in the word and bit dimensions
- Output pins directly opposite corresponding input pins
- Asynchronous or synchronous operation
- Pin compatible with Fairchild's F3341 MOS FIFO and many times as fast

Description

The C5/C67401B/2B/1A/2A/1/2 are "fall-through" high speed First-In First-Out (FIFO) memory organized 64 words by 4-bits and 64 words by 5-bits respectively. A 16.7 MHz data rate allows usage in digital video systems; a 15 MHz data rate allows usage in high speed tape or disc controllers and communication buffer applications. Both word length and FIFO depth are expandable.

Multi-Mode Dynamic RAM Controller/Driver
SN74S409/DP8409

Features/Benefits

- All DRAM drive functions on one chip — minimizes skew on outputs, maximizes AC performance
- On-chip capacitive-load drives (specified to drive up to 88 DRAMs)
- Drives directly all 16k, 64k, and 256k DRAMs
- Capable of addressing 64k, 256k, or 1M words
- Propagation delays of 25ns typical at 500pF load
- $\overline{CAS}$ goes low automatically after column addresses are valid if desired
- Auto Access mode provides $\overline{RAS}$, row to column select, then $\overline{CAS}$ automatically and fast
- $\overline{WE}$ follows $\overline{WIN}$ unconditionally—offering READ, WRITE or READ-MODIFY-WRITE cycles
- On-chip 9-bit refresh counter with selectable End-of-Count (127, 255, or 511)
- End-of-Count indicated by RF I/O pin going low at 127, 255, or 511
- Low input on RF I/O resets 9-bit refresh counter
- $\overline{CAS}$ inhibited during refresh cycle
- Fall-through latches on address inputs controlled by ADS
- Three-state outputs allow multi-controller addressing of memory
- Control output signals go high-impedance logic "1" when disabled for memory sharing
- Power-up: counter reset, control signals high, address outputs three-state and End-of-Count set to 127
- Interchangable with National DP8409
- 8 modes of operation: 3 access, 3 refresh, and 2 set-up
- 2 externally controlled modes: 1 access and 1 refresh (Modes 0, 4)
- 2 auto-access modes $\overline{RAS} \rightarrow R/\overline{C} \rightarrow \overline{CAS}$ automatic, with $t_{RAH} = 20$ or 30ns minimum (Modes 5, 6)
- Auto-access mode allows Hidden Refreshing (Mode 5)
- Forced Refresh requested on RF I/O if no Hidden Refresh (Mode 5)
- Forced Refresh performed after system acknowledge of request (Mode 1)
- Automatic Burst Refresh mode stops at End-of-Count of 127, 255, or 511 (Mode 2)
- 2 All-$\overline{RAS}$ Access modes externally or automatically controlled for memory initialization (Modes 3a, 3b)
- Automatic All-$\overline{RAS}$ mode with external 8-bit counter frees system for other set-up routines (Mode 3a)
- End-of-Count value of Refresh Counter set by B1 and B0 (Mode 7)

Description

Dynamic memory system designs, which formerly required several support chips to drive the memory array, can now be implemented with a single IC . . . the 74S409 Multi-Mode Dynamic RAM Controller/Driver. The 74S409 is capable of driving all 16k and 64k Dynamic RAMs (DRAMs) as well as 256k DRAMs. Since the 74S409 is a one-chip solution (including capacitive-load drivers), it minimizes propagation delay skews, the major performance disadvantage of multiple-chip memory drive and control.

The 74S409's 8 modes of operation offer a wide selection of DRAM control capabilities. Memory access may be controlled externally or on-chip automatically; an on-chip refresh counter makes refreshing (either externally or automatically controlled) less complicated; and automatic memory initialization is both simple and fast.

The 74S409 is a 48-pin DRAM Controller/Driver with 9 multiplexed address outputs and 6 control signals. It consists of two 9-bit address latches, a 9-bit refresh counter, and control logic. All output drivers are capable of driving 500 pF loads with propagation delays of 25 ns. The 74S409 timing parameters are specified driving the typical load capacitance of 88 DRAMs, including trace capacitance.

The 74S409 has 3 mode-control pins: M2, M1, and M0, where M2 is in general REFRESH. These 3 pins select 8 modes of operation. Inputs B1 and B0 in the memory access modes (M2 = 1), are select inputs which select one of four $\overline{RAS}$ outputs. During normal access, the 9 address outputs can be selected from the Row Address Latch or the Column Address Latch. During refresh, the 9-bit on-chip refresh counter is enabled onto the address bus and in this mode all $\overline{RAS}$ outputs are selected, while $\overline{CAS}$ is inhibited.

The 74S409 can drive up to 4 banks of DRAMs, with each bank comprised of 16k's, 64k's, or 256k's. Control signal outputs $\overline{RAS}$, $\overline{CAS}$, and $\overline{WE}$ are provided with the same drive capability. Each $\overline{RAS}$ output drives one bank of DRAMs so that the four $\overline{RAS}$ outputs are used to select the banks, while $\overline{CAS}$, $\overline{WE}$, and the multiplexed addresses can be connected to all of the banks of DRAMs. This leaves the non-selected banks in the standby mode (less than one tenth of the operating power) with the data outputs in three-state. Only the bank with its associated $\overline{RAS}$ low will be written to or read from.

Pin Definitions

V_{CC}, GND, GND — $V_{CC} = 5V \pm 5\%$. The three supply pins have been assigned to the center of the package to reduce voltage drops, both DC and AC. There are also two ground pins to reduce the low level noise. The second ground pin is located two pins from V_{CC}, so that decoupling capacitors can be inserted directly next to these pins. It is important to adequately decouple this device, due to the high switching currents that will occur when all 9 address bits change in the same direction simultaneously. A recommended solution would be a 1 μF multilayer ceramic capacitor in parallel with a low-voltage tantalum capacitor, both connected close to pins 36 and 38 to reduce lead inductance.

R0-R8: Row Address Inputs.

C0-C8: Column Address Inputs.

Q0-Q8: Multiplexed Address Outputs — Selected from the Row Address Input Latch, the Column Address Input Latch, or the Refresh Counter.

$\overline{RASIN}$: Row Address Strobe Input — Enables selected $\overline{RAS}_n$ output when M2 ($\overline{RFSH}$) is high, or all $\overline{RAS}_n$ outputs when $\overline{RFSH}$ is low.

R/$\overline{C}$ (RFCK) — In Auto-Refresh Mode this pin is the external Refresh Clock Input: one refresh cycle has to be performed each clock period. In all other modes it is Row/Column Select Input: selects either the row or column address input latch onto the output bus.

$\overline{CASIN}$ (RGCK) — In Auto-Refresh Mode, Auto Burst Mode, and All-$\overline{RAS}$ Auto-Write Mode, this pin is the $\overline{RAS}$ Generator Clock input. In all other modes it is $\overline{CASIN}$ (Column Address Strobe Input), which inhibits $\overline{CAS}$ output when high in Modes 4 and 3b. In Mode 6 it can be used to prolong $\overline{CAS}$ output.

ADS: Address (Latch) Strobe Input — Strobes Input Row Address, Column Address, and Bank Select Inputs into respective latches when high; Latches on high-to-low transition.

CS: Chip Select Input — Three-state's the Address Outputs and puts the control signal into a high-impedance logic "1" state when high (unless refreshing in one of the Refresh Modes). Enables all outputs when low.

M0, M1, M2: Mode Control Inputs — These 3 control pins determine the 8 major modes of operation of the 74S409 as depicted in Table 1.

RF I/O — The I/O pin functions as a Reset Counter Input when set low from an external open-collector gate, or as a flag output. The flag goes active-low in Modes 0 and 2 when the End-of-Count output is at 127, 255, or 511 (see Table 3). in Auto-Refresh Mode it is the Refresh Request output.

$\overline{WIN}$: Write Enable Input.

$\overline{WE}$: Write Enable Output — Buffered output from $\overline{WIN}$.

$\overline{CAS}$: Column Address Strobe Output — In Modes 3a, 5, and 6, $\overline{CAS}$ transitions low following valid column address. In Modes 3b and 4, it goes low after R/$\overline{C}$ goes low, or follows $\overline{CASIN}$ going low if R/$\overline{C}$ is already low. $\overline{CAS}$ is high during refresh.

$\overline{RAS}$ 0-3: Row Address Strobe Outputs — Selects a memory bank decoded from B1 and B0 (see Table 2), if $\overline{RFSH}$ is high. If $\overline{RFSH}$ is low, all banks are selected.

B0, B1: Bank Select Inputs — Strobed by ADS. Decoded to enable one of the $\overline{RAS}$ outputs when $\overline{RASIN}$ goes low. Also used to define End-of-Count in Mode 7.

Octal Dynamic-RAM Driver with 3-state Outputs

SN54/74S700, SN54/74S730, SN54/74S731, SN54/74S734

Features/Benefits:

- Provides MOS voltage levels for 16K and 64K D-RAMs.
- Undershoot of low-going output is less than -0.5V.
- Large capacitive drive capability.
- Symmetric rise and fall times by balanced output impedence.
- Glitch-free outputs at power-up and power-down.
- 20-pin SKINNYDIP® saves spaces.
- 'S730/734 are exact replacements for the Am2965/66.
- 'S700/730/731/744 are pin-compatible with 'S210/240/241/244, and can replace them in many applications.
- Commercial devices are specified at V_{CC} ±10%.

Ordering Information

PART NUMBER	PKG	TEMP	ENABLE	POLARITY	POWER

SN74S731	N,J	Com			
SN54S734	J,F	Mil	Low		
SN74S734	N,J	Com			

Description:

The 'S700, 'S730, 'S731, and 'S734 are buffers that can drive multiple address and control lines of MOS dynamic RAMs. The 'S700 and 'S730 are inverting drivers and the 'S731 and 'S734 are non-inverting drivers. The 'S700/731 are pin compatible with the 'S210/241 and have complementary enables. The 'S730 is pin compatible with the 'S240 and an exact replacement for the Am2965. The 'S734 is pin compatible with the 'S244 and an exact replacement for the Am2966.

These devices have been designed with an additional internal resistor in the lower output driver transistor circuit, unlike regular octal buffers. This resistor serves two purposes: it causes a slower fall time for a high-to-low transition, and it limits the undershoot without the use of an external series resistor.

The 'S700, 'S730, 'S731, and 'S734 have been designed to drive the highly capacitive input lines of dynamic RAMs. The drivers provide a guaranteed V_{OH} of V_{CC}-1.15 volts, a limit on the undershoot to 0.5V and a rise time symmetrical to the fall time by having balanced outputs. These features enhance dynamic RAM performance.

A typical fully-loaded board dynamic-RAM array consists of 4 banks of dynamic-RAM memory. Each bank has its own $\overline{RAS}$ and $\overline{CAS}$, but has identical address lines. The $\overline{RAS}$ and $\overline{CAS}$ inputs to the array can come from one driver, reducing the skew between the $\overline{RAS}$ and $\overline{CAS}$ signals. Also, only one driver is needed to drive eight address lines of a dynamic RAM. The propagation delays are specified for 50pf and 500pf load capacitances, and the commercial-range specifications are extended to V_{CC} ± 10%.

All of the octal devices are packaged in the popular 20-pin SKINNYDIP.

DIGITAL LOGIC FAMILIES

CMOS • ECL • TTL
MDTL • MHTL

A "Supermarket" For Standard Logic

Motorola carries a comprehensive inventory of standard components encompassing almost all major digital logic families and technologies.

Complementary (very low power) MOS (CMOS)

Series MC14000/MC14500 — These standard lines of *MSI/SSI circuits* contain a complement of nearly 200 device types with which to implement complete system designs. They feature the new JEDEC B-Series specifications with low-power-Schottky compatible outputs. A faster non-buffered line of devices is compatible with the B-Series, as well as with standard Schottky TTL, for mix-and-match versatility.

Series MC14400 — This series of highly complex LSI devices consists of single-chip "subsystems" tailored for specific application. Included are such major functions as smoke detectors, automotive speed-control processors, communications/telephone subsystems, and a variety of other function-dedicated components.

MECL (very high-speed) Logic Circuit

Motorola manufactures two basic lines of emitter-coupled logic (ECL) circuit: The pervasive MECL 10,000 family and more function-limited but higher speed MECL III family. The basic performance differences between these two lines are as follows:

MECL FAMILY COMPARISONS

Feature	MECL 10,000		MECL III
	10,100 Series 10,500 Series	10,200 Series 10,600 Series	
1. Gate Propagation Delay	2 ns	1.5 ns	1 ns
2. Output Edge Speed	2.2 ns	2.0 ns	1 ns
3. Flip-Flop Toggle Speed	160 MHz	250 MHz	300–500 MHz
4. Gate Power	25 mW	25 mW	60 mW
5. Speed Power Product	50 pJ	37 pJ	60 pJ

*Average for Equivalent LSI Gate.

MECL 10,000 Series — A complement of more than 80 circuits, ranging from simple gates to complex functions, such as arithmetic units and memories, populates this family of high-speed logic circuits. Devices are available in two temperature ranges −30 to 85°C and −55 to 125°C to meet the highest standards of performance.

MECL III series — Basic logic circuits designed for highest speed requirements, as in test and communications equipment, and in high-speed sections of larger systems. MECL III circuits are compatible with MECL 10,000 devices to provide the best speed-power combination for system designs.

TTL Circuits

Motorola manufactures several different families of TTL circuits:

The **MC54LS/74LS** Schottky series
The MC3000/3100 series
The MC4000/4300 Series

Of these, the **54LS/74LS** low-power Schottky family is the most pervasive, with a wide selection of MSI components to simplify system designs.

An impressive line of standard TTL complex functions in the MC4000/4300 series, provides significant reduction in package count over systems implemented with simpler families. Phase Locked Loop functions are also available in this series.

Other Logic Families

MHTL Series MC660 — for use in equipment designed for high-noise environments.

MDTL Series MC830/930 — An early logic family manufactured primarily for replacement purposes.

MC12000/12500 — Phase Locked Loop Series.

MECL, MHTL, and MDTL are trademarks of Motorola Inc.

DIGITAL LOGIC FAMILIES

MECL 10KH

New High-Speed Logic Family

Much of the MECL10KH Family of high-speed logic circuits will be pin-compatible with the existing MECL10K Family, but double the performance standards. System clock rates are increased as much as 40%, parasitic capacitance drops by 50%, and propagation delay is reduced by 50% with no corresponding increase in power dissipation. Pin compatibility permits upgrading of existing designs without major modifications. More complex logic functions will be available in the 10KH family than were possible in MECL10K. The MECL10KH Family is performance compatible with the MECL Macrocell Array.

Typical family characteristics for 10K and 10KH circuits

	10K	10KH
Speed (ns)	2.0	1.0

FAST TTL 54F00/74F00

Integrated Circuits

The FAST Schottky TTL family provides a 75–80% power reduction compared to standard Schottky (54/74S) TTL and yet offers a 20–40% improvement in circuit performance over the standard Schottky due to Motorola's state-of-the-art oxide isolated process (MOSAIC). This is a new product line; contact your Motorola representative for complete details and current introduction status.

ALS TTL 54ALS00/74ALS00

Integrated Circuits

The Advanced Low Power Schottky TTL family (ALS TTL) provides a 50% power reduction compared to standard 54/74LS TTL and yet offers improved circuit performance over the standard LS due to Motorola's state-of-the-art oxide isolated process (MOSAIC). This is a new product line; contact your Motorola representative for complete details and current introduction status.

SN54ALS00 Series (−55 to +125°C)
SN74ALS00 Series (0 to +70°C)

Suffix: J . . . Ceramic (54/74 series)

ALS TTL INTRODUCTION LIST

Device	Function	Available	Pins
ALS00	Quad 2-Input NAND Gate	Now	14
ALS01	Quad 2-Input NAND Gate, Open-Collector	4Q82	14
ALS02	Quad 2-Input NOR Gate	1Q83	14
ALS03	Quad 2-Input NAND Gate, Open-Collector	4Q82	14
ALS04	Hex Inverter	Now	14
ALS05	Hex Inverter, Open-Collector	Now	14
ALS08	Quad 2-Input AND Gate	Now	14
ALS09	Quad 2-Input AND Gate, Open-Collector	1Q83	14
ALS10	Triple 3-Input NAND Gate	1Q83	14
ALS11	Triple 3-Input AND Gate	1Q83	14
ALS12	Triple 3-Input NAND Gate, Open-Collector	1Q83	14
ALS13	Dual 4-Input Schmitt Trigger	2Q83	14
ALS14	Hex Schmitt Trigger	2Q83	14
ALS15	Triple 3-Input Schmitt Trigger	1Q83	14
ALS20	Dual 4-Input NAND Gate	4Q82	14
ALS22	Dual 4-Input NAND Gate, Open-Collector	4Q82	14
ALS27	Triple 3-Input NOR Gate	1Q83	14
ALS28	Quad 2-Input NOR Buffer	4Q82	14
ALS32	Quad 2-Input OR Gate	4Q82	14
ALS33	Quad 2-Input NOR Buffer, Open-Collector	4Q82	14
ALS37	Quad 2-Input NAND Buffer	4Q82	14
ALS38	Dual 4-Input NAND Buffer	4Q82	14
ALS40	Dual 4-Input NAND Buffer	4Q82	14
ALS74	Dual D Flip Flop	Now	14
ALS109	Dual J-K Flip Flop W/Preset	4Q82	16
ALS132	Quad 2-Input Schmitt Trigger	2Q83	14
ALS138	1-Of-8 Decoder/Demultiplexer	4Q82	16
ALS139	Dual 1-Of-4 Decoder/ Demultiplexer	4Q82	16
ALS151	8-Input Multiplexer	1Q83	16
ALS153	Dual 4-Input Multiplexer	4Q82	16
ALS157	Quad 2-Input Multiplexer/ Non-Inverting	4Q82	16
ALS158	Quad 2-Input Multiplexer/ Inverting	4Q82	16
ALS160	BCD Decade Counter/ Asynchronous Reset (9910 Type)	4Q82	16
ALS161	4-Bit Binary Counter, Asynchronous Reset (9316 Type)	4Q82	16
ALS162	BCD Decade Counter/ Synchronous Reset	4Q82	16
ALS163	4-Bit Binary Counter/ Synchronous Reset	4Q82	16
ALS164	8-Bit Serial-In/Parallel-Out Shift Register	1Q83	14
ALS168	4-Bit Up/Down Decade Counter/ Synchronous Reset	1Q83	16
ALS169	4-Bit Up/Down Binary Counter/ Synchronous Reset	1Q83	16
ALS190	Up/Down Decade Counter	4Q82	16
ALS191	Up/Down Binary Counter	4Q82	16
ALS192	Up/Down Decade Counter W/Clear	4Q82	16
ALS193	Up/Down Binary Counter W/Clear	4Q82	16
ALS238	1-Of-8 Decoder/Demultiplexer/ (Active High Outputs)	4Q82	16
ALS239	Dual 1-Of-4 Decoder/ Demultiplexer/(Active High Outputs)	4Q82	16
ALS240	Octal Bus/Line Driver/Inverting/ 3-State	Now	20
ALS241	Octal Bus/Line Driver/3-State	Now	20
ALS242	Quad Bus Transceiver/ Inverting/3-State	Now	14
ALS243	Quad Bus Transceiver/ Non-Inverting/3-State	Now	14
ALS244	Octal Driver/Non-Inverting/ 3-State	Now	20
ALS245	Octal Bus Transceiver/ Non-Inverting/3-State	Now	20
ALS251	8-Input Multiplexer/3-State	1Q83	16
ALS253	Dual 4-Input Multiplexer/ 3-State	4Q82	16
ALS257	Quad 2-Input Multiplexer/ Non-Inverting/3-State	1Q83	16
ALS258	Quad 2-Input Multiplexer/ Inverting/3-State	1Q83	16
ALS273	Octal D Flip Flop W/Clear	Now	20
ALS352	Dual 4-Multiplexer/Inverting ALS 153	4Q82	16
ALS353	Dual 4-Multiplexer/3-State ALS 352	4Q82	16
ALS373	Octal Transparent Latch/ 3-State	1Q83	20
ALS374	Octal D Flip Flop/3-State	1Q83	20
ALS377	Octal D Flip Flop W/Enable	Now	20
ALS533	Octal Transparent Latch/ Inverting	1Q83	20
ALS534	Octal D-Type Flip Flop/Inverting	1Q83	20
ALS537	1-Of-10 Decoder/3-State	1Q83	20
ALS538	1-Of-8 Decoder/3-State	1Q83	20
ALS539	Dual 1-Of-4 Decoder/3-State	1Q83	20
ALS540	Octal Buffer/3-State	2Q83	20
ALS541	Octal Buffer/3-State	2Q83	20
ALS560	4-Bit Decade Counter/3-State	1Q83	20
ALS561	4-Bi Binary Counter/3-State	1Q83	20
ALS563	8-Bit Latch/3 State	2H83	20
ALS564	Octal D Flip Flop/3-State	2H83	20
ALS568	Decade Up/Down Counter/ 3-State	4Q82	20
ALS569	Binary Up/Down Counter/ 3-State	4Q82	20
ALS573	Octal Transparent Latch/ 3-State	2H83	20
ALS574	Octal D Flip Flop/3-State	2H83	20
ALS576	Octal D Flip Flop/Inverting/ 3-State	2H83	20
ALS580	Octal Transparent Latch/ Inverting/3-State	2H83	20
ALS620	Octal Transceiver W/Storage/ 3-State	Now	20
ALS621	Octal Transceiver W/Storage/ Open Collector	Now	20
ALS622	Octal Transceiver W/Storage/ Open Collector	Now	20
ALS623	Octal Transceiver W/Storage/ 3-State	Now	20
ALS638	Octal Bus Transceiver/Inverting/ 3-State	Now	20
ALS639	Octal Bus Transceiver/3-State	Now	20
ALS640	Octal Bus Transceiver/Inverting/ 3-State	Now	20
ALS641	Octal Bus Transceiver/ Non-Inverting/Open Collector	Now	20
ALS642	Octal Bus Transceiver/Inverting/ Open Collector	Now	20
ALS643	Octal Bus Transceiver/True/ Inverting/3-State	Now	20
ALS644	Octal Bus Transceiver/True/ Inverting/Open Collector	Now	20
ALS646	Octal Transceiver/Latch/ Multiplexer/Non-Inverting/ 3-State	1Q83	24
ALS647	Octal Transceiver/Latch/ Multiplexer/Non-Inverting/Open Collector	1Q83	24
ALS648	Octal Transceiver/Latch/ Multiplexer/Inverting/3-State	1Q83	24
ALS649	Octal Transceiver/Latch/ Multiplexer/Inverting/Open Collector	1Q83	24
ALS671	Binary Bidirectional Shift Register/Latch/Multiplexer/ 3-State	4Q82	20
ALS672	BCD Bidirectional Shift Register/Latch/Multiplexer/ 3-State	4Q82	20
ALS690	Decade Counter/Latch/ Multiplexer/Asynchronous Reset/3-State	4Q82	20
ALS691	Binary Counter/Latch/ Multiplexer/Asynchronous Reset/3-State	4Q82	20
ALS692	Decade Counter/Latch/ Multiplexer/Synchronous Reset/3-State	4Q82	20
ALS693	Binary Counter/Latch/ Multiplexer/Synchronous Reset/3-State	4Q82	20
ALS694	Decade Counter/Latch/ Multiplexer/Synchronous/ Asynchronous Reset/3-State	4Q82	20
ALS695	Binary Counter/Latch/ Multiplexer/Synchronous/ Asynchronous Reset/3-State	4Q82	20
ALS696	Decade Counter/Register/ Multiplexer/3-State	4Q82	20
ALS697	Binary Counter/Register/ Multiplexer/3-State	4Q82	20
ALS698	Decade Counter/Register/ Multiplexer/3-State	4Q82	20
ALS699	Binary Counter/Register/ Multiplexer/3-State	4Q82	20
ALS790	Error Detection and Correction Circuit	See F2960	
ALS873	Octal Transparent Latch	2H83	24
ALS874	Octal D Flip Flop	2H83	24
ALS876	Octal D Flip Flop/Inverting	2H83	24
ALS880	Octal Transparent Latch/ Inverting	2H83	24

High-Speed CMOS Logic Family

MC54/74HCXXX

For the first time, a higher-performance standard digital logic family is available that combines the popular features of CMOS and the traditional characteristics of LSTTL. Previously, designers were forced to choose between CMOS low power dissipation and good noise immunity and LSTTL high operating frequencies, short propagation delays, and good fanout or drive capability. The best of both technologies is now available in Motorola's newest digital logic family – High-Speed CMOS Logic (MC54/74HC). Higher performance is available for most applications – yielding speed improvements as well as significant cost savings.

The family is composed of gates, flip-flops, buffers, octal devices and various MSI functions such as counters, shift registers, and decoders. Many of the popular CMOS and LS functions have been incorporated into the new logic family with full pinout capability for each function. In addition, the family has temperature ratings of −40 to +85°C (74 series) and −55 to 125°C (54 series) for both commercial and high-reliability requirements. The base LS supply voltage of 5 V ±10% has been increased to a full rating of 2-6 V with the absolute maximum limited at −0.5 and 7 V. Because of its extra speed and performance, the High-Speed CMOS Logic Family provides an ideal interface for CMOS memory and microprocessor system applications. Examples of the increased operating parameters are shown in the charts below.

Family Comparisons in Key Specifications (Typical Gate)

Specification	CMOS	LS	HC
Propagation Delay (t_{PHL}/t_{PLH})	300 ns	15 ns	15 ns
Quiescent Power Dissipation	40 μW	22 mW	100 μW
Input Current	±1.0 μA	0.1 mA	±1.0 μA
Maximum Operating Frequency (f_{max})	>1 MHz	30 MHz	30 MHz
Fanout Capability (LS Drive)	1 Load	10 Loads	10 Loads
Worst Case Noise Margins V_{NL} V_{NH}	 29% V_{CC} 29% V_{CC}	 8% V_{CC} 14% V_{CC}	 19% V_{CC} 29% V_{CC}
Quiescent Current (Per Package)	7.5 μA	4.4 mA	20 μA
Operating Temperature	−40 to +85°C −55 to +125°C	0 to +70°C −55 to +125°C	−40 to +85°C −55 to +125°C

Forty-three (43) devices are available through September 1982, with specific device introductions continuing through 1983. Contact your Motorola representative for pricing and sample availability.

SWITCHING CHARACTERISTICS (Tentative Maximum Values)

Symbol	Parameters	74HC244 Bus Driver	74HC74 D Flip-Flop	74HC194 Register	74HC00 Gate
f_{max}	Maximum Clock Frequency	–	30 MHz	30 MHz	–
t_{PHL}/t_{PLH}	Prop. Delay, Clock to Q	18 ns	30 ns	26 ns	15 ns
t_{su}	Setup Time, Data to Clock	–	20 ns	20 ns	–
t_h	Hold Time, Clock to Data	–	0 ns	0 ns	–
t_w	Pulse Width, Clock and Clear	–	16 ns	16 ns	–
t_r	Input Clock Rise Time	500 ns	500 ns	500 ns	–
C_{PD}*	Power Dissipation	100 pF	100 pF	100 pF	100 pF
t_{PZL}/t_{PZH}	Three-State Enable Time	30 ns	–	–	–
t_{PLZ}/t_{PHZ}	Three-State Disable Time	25 ns	–	–	–

*C_{PD} is an equivalent device capacitance for calculating power dissipation using $P_D = C_{PD} V_{CC}^2 f$

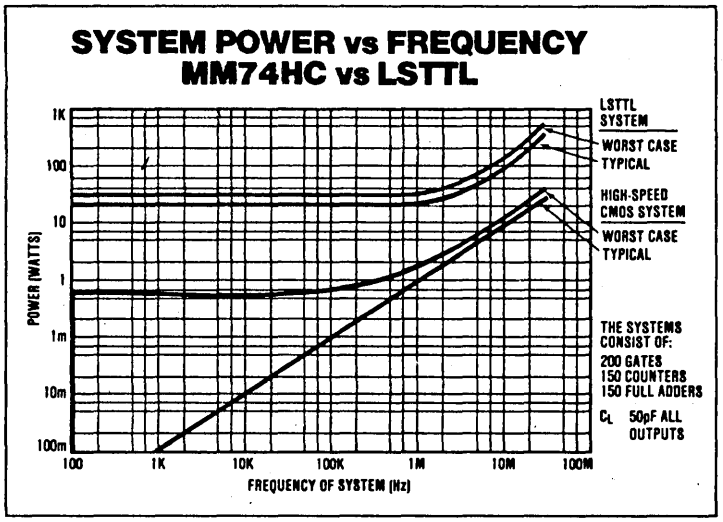
MM74HCXXXX High Speed CMOS Logic Family

Combines:
CMOS μW Power Dissipation
CMOS High Noise Immunity
With
LS Equivalent Speeds
LS Output Drive
LS Pinout



HIGH SPEED CMOS PRODUCT GUIDE

NAND / NOR Gates

MM54HC00 / MM74HC00 Quad 2-Input NAND Gate
MM54HC02 / MM74HC02 Quad 2-Input NOR Gate
MM54HC10 / MM74HC10 Triple 3-Input NAND Gate
MM54HC20 / MM74HC20 Dual 4-Input NAND Gate
MM54HC27 / MM74HC27 Triple 3-Input NOR Gate
MM54HC30 / MM74HC30 8-Input NAND Gate
MM54HC133 / MM74HC133 13-Input NAND Gate
MM54HC4002 / MM74HC4002 Dual 4-Input NOR Gate
MM54HC4078 / MM74HC4078 8-Input NOR Gate

AND / OR / XOR / XNOR Gates

MM54HC08 / MM74HC08 Quad 2-Input AND Gates
MM54HC11 / MM74HC11 Triple 3-Input AND Gate
MM54HC32 / MM74HC32 Quad 2-Input OR Gate
MM54HC86 / MM 74HC86 Quad 2-Input Exclusive-OR (XOR) Gate
MM54HC266 / MM74HC266 Quad 2-Input Exclusive NOR (XNOR) Gate
MM54HC4075 / MM74HC4075 Triple 3-Input OR Gate

Inverters / Non-Inverting Buffers / Bus Drivers

MM54HC04 / MM74HC04 Hex Inverter
MM54HC240 / MM74HC240 Inverting Octal TRI-STATE® Buffer
MM54HC241 / MM74HC241 Octal TRI-STATE Buffer
MM54HC244 / MM74HC244 Octal TRI-STATE Buffer
MM54HC365 / MM74HC365 Hex TRI-STATE Buffer
MM54HC366 / MM74HC366 Inverting Hex TRI-STATE Buffer
MM54HC367 / MM74HC367 Hex TRI-STATE Buffer
MM54HC368 / MM74HC368 Inverting Hex TRI-STATE Buffer
MM54HC4049 / MM74HC4049 Hex Inverting Logic Level Down Converter
MM54HC4050 / MM74HC4050 Hex Logic Level Down Converter
MM54HC4305 / MM74HC4305 TTL Input Octal TRI-STATE Inverting Buffer
MM54HC4306 / MM74HC4306 TTL Input Octal TRI-STATE Buffer

Bus Transceivers

MM54HC242 / MM74HC242 Inverting Quad TRI-STATE Transceiver
MM54HC243 / MM74HC243 Quad TRI-STATE Transceiver
MM54HC245 / MM74HC245 Octal TRI-STATE Transceiver
MM54HC640 / MM74HC640 Inverting Octal TRI-STATE Transceiver
MM54HC643 / MM74HC643 Octal TRI-STATE Transceiver
MM54HC646 / MM74HC646 Octal Bus Transceivers / Registers
MM54HC648 / MM74HC648 Inverting Octal Bus Transceivers / Registers

Schmitt Triggers

MM54HC14 / MM74HC14 Hex Inverting Schmitt Trigger
MM54HC132 / MM74HC132 Quad 2-Input NAND Schmitt Trigger

One Shots

MM54HC123 / MM74HC123 Dual Monostable Multivibrator
MM54HC221 / MM74HC221 Dual Monostable Multivibrator
MM54HC4538 / MM74HC4538 Retriggerable Monostable Multivibrator

Arithmetic Circuits

MM54HC85 / MM74HC85 4-Bit Magnitude Comparator
MM54HC688 / MM74HC688 8-Bit Magnitude Comparator

Flip-Flops / Latches / Registers

MM54HC73 / MM74HC73 Dual J-K Flip-Flop with Clear
MM54HC74 / MM74HC74 Dual D Flip-Flop with Preset and Clear
MM54HC75 / MM74HC75 4-Bit Bistable Latch with Q and $\overline{Q}$ Output
MM54HC76 / MM74HC76 Dual J-K Flip-Flop with Preset and Clear
MM54HC77 / MM74HC77 4-Bit Bistable Latch
MM54HC107 / MM74HC107 Dual J-K Flip-Flop with Clear
MM54HC109 / MM74HC109 Dual J-$\overline{K}$ Flip-Flop with Preset and Clear
MM54HC112 / MM74HC112 Dual J-K Flip-Flop with Preset and Clear
MM54HC173 / MM74HC173 TRI-STATE® Quad D Flip-Flop

Flip-Flops / Latches / Registers

MM54HC174 / MM74HC174 Hex D Flip-Flop with Clear
MM54HC175 / MM74HC175 Quad D-Type Flip-Flop with Clear
MM54HC259 / MM74HC259 8-Bit Addressable Latch / 3-to-8 Line Decoder
MM54HC373 / MM74HC373 TRI-STATE Octal D-Type Latch
MM54HC374 / MM74HC374 TRI-STATE Octal D-Type Flip-Flop
MM54HC533 / MM74HC533 TRI-STATE Octal D-Type with Inverting Outputs
MM54HC534 / MM74HC534 TRI-STATE Octal D-Type Flip-Flop with Inverting Outputs
MM54HC563 / MM74HC563 TRI-STATE Octal D-Type Latch with Inverting Outputs
MM54HC564 / MM74HC564 TRI-STATE Octal D-Type Flip-Flop with Inverting Outputs
MM54HC573 / MM74HC573 TRI-STATE Octal D-Type Latch
MM54HC574 / MM74HC574 TRI-STATE Octal D-Type Flip-Flop
MM54HC646 / MM74HC646 Non-Inverting Octal Bus Transceivers / Registers
MM54HC648 / MM74HC648 Inverting Octal Bus Transceivers / Registers
MM54HC4301 / MM74HC4301 TTL Input Octal TRI-STATE Latch (Inverting)
MM54HC4302 / MM74HC4302 TTL Input Octal TRI-STATE Latch
MM54HC4303 / MM74HC4303 TTL Input Octal TRI-STATE Flip-Flop (Inverting)
MM54HC4304 / MM74HC4304 TTL Input Octal TRI-STATE Flip-Flop

Shift Registers

MM54HC164 / MM74HC164 8-Bit Serial-In Parallel-Out Shift Register
MM54HC165 / MM74HC165 8-Bit Parallel-In Serial Out Shift Register
MM54HC194 / MM74HC194 4-Bit Bidirectional Universal Shift Register
MM54HC195 / MM74HC195 4-Bit Parallel-Shift Register
MM54HC299 / MM74HC299 8-Bit TRI-STATE Universal Shift Register

Counters

MM54HC160 / MM74HC160 Synchronous Decade Counter
MM54HC161 / MM74HC161 Synchronous Binary Counter
MM54HC162 / MM74HC162 Synchronous Decade Counter
MM54HC163 / MM74HC163 Synchronous Binary Counter
MM54HC192 / MM74HC192 Synchronous Decade Up / Down Counter
MM54HC193 / MM74HC193 Synchronous Binary Up / Down Counter
MM54HC390 / MM74HC390 Dual 4-Bit Decade Counter
MM54HC393 / MM74HC393 Dual 4-Bit Binary Counter
MM54HC4017 / MM74HC4017 Decade Counter / Divider with 10 Decoded Outputs
MM54HC4020 / MM74HC4020 14 Stage Binary Counter
MM54HC4040 / MM74HC4040 12 Stage Binary Counter
MM54HC4060 / MM74HC4060 14 Stage Binary Counter

Decoders / Encoders

MM54HC42 / MM74HC42 BCD-to-Decimal Decoder
MM54HC138 / MM74HC138 3-to-8 Line Decoder
MM54HC139 / MM74HC139 Dual 2-to-4 Line Decoder
MM54HC147 / MM74HC147 10-Line to 4-Line Priority Encoder
MM54HC154 / MM74HC154 4-to-16 Line Decoder
MM54HC259 / MM74HC259 8-Bit Addressable Latch / 3-to-8 Line Decoder
MM54HC280 / MM74HC280 Odd / Even Parity Generator / Checker

NATIONAL SEMICONDUCTOR MOS/LSI

PART TYPE	DESCRIPTION	FEATURES
MM74CXXX-SERIES DISPLAY DRIVERS		
MM74C945/7	4-digit up/down counter w/latch/decoder driver	• 4-decade U/D counter • Schmitt trigger clock input • Direct 4-digit drive • Store and reset inputs
MM74C946N	4½-digit counter/decoder driver for LCD displays	• Direct 4½-digit 7-segment display drive • Carry output for cascading 4-digit blocks • Store and reset inputs
MM74C911	4-digit display controller	• TTL-compatible inputs • Internal oscillator • Segment expandability
MM74C912	6-digit BCD display/driver	• TTL-compatible inputs • Internal-segment decoder • Direct-base drive-to-digit transistors
MM74C917	6-digit hex display/driver	• TTL-compatible inputs • Internal-segment decoder • Direct-base drive-to-digit transistors
MM54XX-SERIES DISPLAY DRIVERS		
MM5450/51	34/35 segment LED	• Serial data in • Brightness control • Data enable, cascadeable
MM5452/53	32/33 segment LCD	• Serial data in • Oscillator on-board • Data enable, cascadeable
MM5445/6/7/8	33-35 segment VF	• Serial data in • Brightness control • Data enable, cascadeable
MICROPROCESSOR-COMPATIBLE CLOCKS — LOW-POWER CMOS		
MM58167A	8-bit bus clock	• Time: 1/100 sec ~ months • RAM: 56 bits • Interrupts: 1 sec ~ 1 month and RAM compare
MM58174A	4-bit bus clock	• Package: 24-pin • Time: 1/10 sec ~ years • Interrupts: 0.5-, 5-, 60-sec • Package: 16-pin
DIGITAL CLOCK/RADIO		
MM5458/59	Alarm clock/radio	• LED duplex • 12/24-hour, 50/60 Hz • Sleep/snooze • Battery back-up
MM5466	Dual alarm clock/radio	• LED duplex • 12/24-hour, 50/60 Hz • Sleep/snooze • Battery back-up

MM74HC942 300 Baud P²CMOS™ Modem

General Description

The MM74HC942 is a full duplex low speed modem. It provides a 300 baud bidirectional serial interface for data communication over telephone lines and other narrow bandwidth channels. It is Bell 103 compatible.

The device is manufactured on National's P² CMOS™ process. Switched capacitor techniques are used to perform analog signal processing.

MODULATOR SECTION

The modulator contains a frequency synthesizer and a sine wave synthesizer. It produces a phase coherent frequency shift keyed (FSK) output.

LINE DRIVER AND HYBRID SECTION

The line driver and hybrid are designed to facilitate connection to a 600 Ω phone line. They can perform two to four wire conversion and drive the line at 0 dBm.

DEMODULATOR SECTION

The demodulator incorporates anti-aliasing filters, a receive filter, limiter, discriminator, and carrier detect circuit. The nine pole receive filter provides 60 dB of transmitted tone rejection. The discriminator is fully balanced for stable operation.

P² CMOS™ is a trademark of National Semiconductor Corp.

Features

- All filtering, modulator, demodulator, line driver, and hybrid on single IC
- Full duplex answer or originate modes — Bell 103 compatible
- Low operating power *plus* "stand-by" power-down mode
- Analog loopback for self test
- ±5V supplies
- Adjustable "carrier detect" and "transmit" levels

Applications

- Built-in low speed-modems — personal computers
- Remote data collection
- Radio telemetry
- Credit verification
- Stand-alone modems
- Remote process control
- Portable terminals

Programmable Array Logic (PAL®) High-Speed PAL Series 20A

General Description

The PAL® family utilizes National Semiconductor's Schottky TTL process and bipolar PROM fusible-link technology to provide user-programmable logic to replace conventional SSI/MSI gates and flip-flops. Typical chip count reduction gained by using PALs is greater than 4:1.

The family lets the systems engineer customize his chip by opening fusible links to configure AND and OR gates to perform his desired logic functions. Complex interconnections that previously required time-consuming layout are thus transferred from PC board to silicon where they can be easily modified during prototype checkout or production.

The PAL transfer function is the familiar sum of products with a single array of fusible links. Unlike the PROM, the PAL is a programmable AND array driving a fixed OR array. (The PROM is a fixed AND array driving a programmable OR array.) In addition, the PAL family offers these options:

- Variable input/output in ratio
- Programmable TRI-STATE® outputs
- Registers and feedback

Unused inputs are tied directly to V_{CC} or GND. Product terms with all fuses blown assume the logical high state, and product terms connected to both true and complement of any single input assume the logical low state. Registers consist of D type flip-flops that are loaded on the low-to-high transition of the clock. PAL logic diagrams are shown with all fuses blown, enabling the designer use of the diagrams as coding sheets.

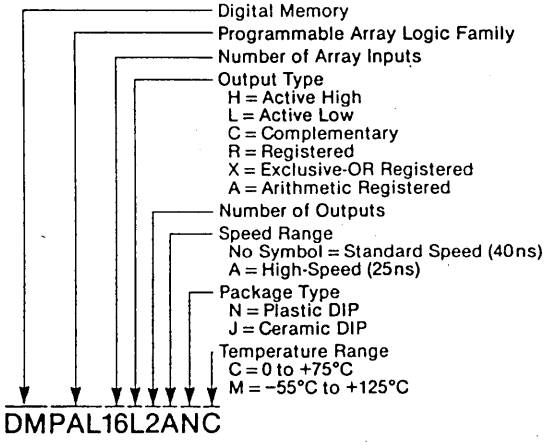
The entire PAL family is programmed on inexpensive conventional PROM programmers with appropriate personality and socket adapter cards. Once the PAL is programmed and verified, two additional fuses may be blown to defeat verification. This feature gives the user a proprietary circuit which is very difficult to copy.

Features

- Programmable replacement for TTL logic
- Simplifies prototyping and board layout
- Skinny DIP packages
- Reliable titanium-tungsten fuses
- 25ns max. propagation delay

Ordering Information

Part Number	Description	
PAL10H8A	OCTAL	10 Input AND-OR Gate Array
PAL12H6A	HEX	12 Input AND-OR Gate Array
PAL14H4A	QUAD	14 Input AND-OR Gate Array
PAL16H2A	DUAL	16 Input AND-OR Gate Array
PAL16C1A		16 Input AND-OR/AND-OR-INVERT Gate Array
PAL10L8A	OCTAL	10 Input AND-OR-INVERT Gate Array
PAL12L6A	HEX	12 Input AND-OR-INVERT Gate Array
PAL14L4A	QUAD	14 Input AND-OR-INVERT Gate Array
PAL16L2A	DUAL	16 Input AND-OR-INVERT Gate Array
PAL16L8A	OCTAL	16 Input AND-OR-INVERT Gate Array
PAL16R8A	OCTAL	16 Input Registered AND-OR Gate Array
PAL16R6A	HEX	16 Input Registered AND-OR Gate Array
PAL16R4A	QUAD	16 Input Registered AND-OR Gate Array



PAL Part Numbers

The PAL part number reveals the logic operation the part performs. The example shown, the DMPAL16L2ANC, is a device that accommodates 16 input terms and generates 2 active-low output terms. It is contained in a 20-pin plastic dual-in-line package and meets commercial temperature range specifications.

TRI-STATE® is a registered trademark of National Semiconductor Corp.
PAL® is a registered trademark of Monolithic Memories, Inc.

The QMOS Product Line

The RCA QMOS series of high-speed CMOS logic integrated circuits include an extensive line of products that are pin compatible with many existing bipolar 54/74LSTTL and CMOS 4000 series of digital logic types. The new QMOS IC's provide high-speed CMOS replacements for the most popular LSTTL devices in existing designs and also offer low-power all-CMOS designs for new digital systems. Key family features of the RCA QMOS types include:

- Speeds equivalent to LSTTL types with typical gate delays of 10 ns.
- Fanout to 10 74 LSTTL loads; 15 loads using Bus Driver 54/74 types.
- Operating frequencies equivalent to LSTTL types, typically 30 MHz.
- The high voltage noise immunity characteristic of CMOS, typically 45 percent of V_{CC}, a two to three times improvement over LSTTL.
- Wide range of power supply operating voltages, 2 to 6 volts.
- CMOS low static power consumption, typically less than 1 microwatt.

With the broad line of CMOS MSI function types currently available, together with performance offered by the RCA QMOS series of high-speed CMOS integrated circuits, the designer need not sacrifice speed for power consumption. Add the other classical advantages of CMOS, including high noise immunity and wide power supply and temperature ranges, and the decision to use high-speed CMOS logic (QMOS) is the choice for the 80's. This new family provides for the design of more cost-effective systems to serve high-speed market applications.

The RCA QMOS product line consists primarily of CD54/74HC-series types, which feature CMOS input voltage level compatibility, and CD54/74HCT-series types, which are input voltage level compatible with LSTTL devices. The QMOS line also includes a limited number of single-stage, unbuffered inverter types (CD54/74HCU-series) for added versatility in oscillator and amplifier applications. The following paragraphs outline some key advantages that QMOS IC's offer over standard CMOS and LSTTL types:

Power Consumption

CMOS is well established in the marketplace as the leading technology for applications in which low power consumption is a prime requisite. Relative to LSTTL, CMOS IC's feature low static power dissipation or heat generation. In comparison to 54/74-series LSTTL types, RCA QMOS devices enhance system reliability and reduce costs by reducing, or eliminating, the number and size of parts such as heat sinks, fans, tightly regulated high current power supplies, and copper busses. A typical system in which LSTTL types have been replaced by equivalent QMOS types can be expected to operate with only 1% of the power, assuming that all logic nodes are switched at an average rate of 10 KHz. Although some QMOS logic nodes may switch at speeds greater than 10 MHz, it's the over-all duty cycle and average switching rate that counts. This average switching is the key to the advantage of CMOS low power. For LSTTL, the high dc current dominates.

Noise Immunity Consideration

The noise immunity of a logic family is also an important equipment cost factor in terms of decoupling components, power supply dynamic resistance and regulation, and layout rules for PC boards and signal cables. A true system assessment of noise immunity is the noise margin provided by a logic family. The table shown below illustrates the superior (2:1) system noise margin of the QMOS CD74HC series over the 74LSTTL series. The system noise margin of CD74HCT series is similar to that of 74LSTTL series.

TABLE 1—74LSTTL AND CD74HC FAMILY INPUT, OUTPUT, AND NOISE MARGIN VOLTAGES (V_{CC} = 5 V)

Parameter	74LSTTL Series	CD74HC Series
V_{IL}	0.8 V	1 V
V_{IH}	2 V	3.5 V
V_{OH}	2.7 V	4.9 V
V_{OL}	0.4 V	0.1 V
$V_{NML} = V_{IL} - V_{OL}$ (Noise Margin LOW)	0.4 V	0.9 V
$V_{NMH} = V_{OH} - V_{IH}$ (Noise Margin High)	0.7 V	1.4 V

AC Performance

In comparison to standard CD4000 Series CMOS, LSTTL types provide higher operating frequencies as well as considerably shorter propagation delays, The RCA QMOS high-speed logic series is designed to meet the dynamic switching speeds and operating frequency of LSTTL. This new series, therefore, offers a high-performance family of low power logic products that should be widely accepted in computer and communication applications and for other uses that require fast switching speed.

Output Drives

A prominent characteristic of LSTTL is its restrictive output drive capacity, or fanout rules. Each basic logic type in the RCA QMOS High-Speed CMOS series is capable of driving a full complement of 10 LSTTL loads (4mA at 0.4 V). An additional factor of 50% was applied to parts in the octal grouping for a total bus driving capability of 6 mA or a fanout of 15 LSTTL loads. These improved drive capabilities are achieved without sacrifice of the power, speed, and noise immunity benefits of the CMOS family. For driving QMOS loads, a fanout of 20 at high noise margin is specified. This fanout capability is twice that of standard 74LSTTL Much higher fanout capability exists for QMOS types, but speed and noise margin are reduced.

RECOMMENDED OPERATING CONDITIONS:

For maximum reliability, nominal operating conditions should be selected so that operation is always within the following ranges:

CHARACTERISTIC	LIMITS		UNITS
	MIN.	MAX.	
Supply-Voltage Range (For T_A = Full Package Temperature Range) V_{CC}:*			
CD54/74HC, CD54/74HCU Types	2	6	V
CD54/74HCT Types▲	4.5	5.5	V
DC Input or Output Voltage V_{in}, V_{out}	0	V_{CC}	V
Operating Temperature T_A:			
CD74 Types	−40	+85	°C
CD54 Types	−55	+125	°C
Input Rise and Fall Times t_r, t_f (except for Schmitt Inputs)	0	500	ns

*Unless otherwise specified, all voltages are referenced to Ground.

▲DC and AC parameters are specified at 4.5 to 5.5 V. The truth table, as applicable, is specified over a voltage range of 2 to 6 volts.

STATIC ELECTRICAL CHARACTERISTICS for CD74HC/CD54HC Types

CD40116

Preliminary Data

COS/MOS High-Speed 8-Bit Bidirectional CMOS/TTL Interface Level Converter

The RCA-CD40116 is a high-speed 8-bit integrated circuit designed to interface CMOS logic levels with TTL logic levels on the data bus of microprocessor-based systems. CMOS/TTL interface is provided by eight parallel bidirectional buffer/level converters. Buffer INPUT/OUTPUT terminals are either inputs or outputs depending on the desired direction of data flow.

A low level on the DISABLE input with the ENABLE input either high or low, permits conversion of CMOS inputs to TTL outputs. A high level on both the DISABLE and ENABLE inputs permits data flow from TTL inputs to CMOS outputs. A low level on the ENABLE input and a high level on the DISABLE input sets both inputs/outputs to the high-impedance state.

The TTL Input/Output terminals and the ENABLE and DISABLE control inputs are TTL-compatible without the use of external pull-up resistors. The TTL input logic 0 to logic 1 transition occurs at a level of approximately 1.5 volts. The ENABLE and DISABLE inputs may be driven to the V_{DD} rail; therefore, either TTL or CMOS logic drivers, capable of sinking one TTL load, may be used to determine the direction of data flow. The large CMOS and TTL output buffers in this device have high output sink and source current capability and can drive the data bus capacitance with a transition time of approximately 0.25 ns/pF. This fast output transition time, together with the small propagation delay time of the device, allow high-speed operation.

The CD40116 is supplied in a 22-lead hermetic dual-in-line ceramic package (D suffix) and a 22-lead dual-in-line plastic package (E suffix).

Features:

- **Eight inverting channels with conversion from V_{DD} to V_{CC} or V_{CC} to V_{DD} ($4\ V \leq V_{DD} \leq 12\ V$ and $4\ V \leq V_{CC} \leq V_{DD}$)**
- **Three operating modes:**
  CMOS-to-TTL level conversion
  TTL-to-CMOS level conversion
  Interface off; high-impedance on both sides
- **Low propagation delay time:**
  CMOS-to-TTL conversion — 15 ns typ.
  TTL-to-CMOS conversion — 30 ns typ.
  (V_{DD} = 12 V, V_{CC} = 5 V)
- **High TTL sink current — 11 mA typ.**
- **No external TTL input pull-up resistors required**
- **High speed drive of large data bus capacitances**
- **Input/output and power supply terminals located for ease of PC board layout**

Applications:

- **Interface CMOS microprocessor with TTL memories and peripheral devices**
- **Interface between and within logic systems which combine CMOS and TTL devices**

CD40117B Types Programmable Dual 4-Bit Terminator

Preliminary Data

High-Voltage Types (20-Volt Rating)

The RCA-CD40117B Programmable Terminator consists of two 4-bit Terminators that are capable of terminating a data bus to a high or low logic state. They can also terminate any open or unused CMOS logic input to the last driven logic state when used with a 3-state logic, or during a power down condition. The Terminator reduces power consumption by eliminating pull-up or pull-down resistors and may be beneficial in improving board density. It also performs SET or RESET functions for CMOS logic inputs when the STROBE input is high and the DATA input is high or low respectively. When the STROBE input is held low, the terminated input/output lathes the last DATA input until the terminated input/output changes state. This device functions as an 8-bit terminator when the DATA inputs are connected together and the STROBE inputs are connected togther. The CD40117B types are supplied in 14-lead hermetic dual-in-line ceramic packages (D and F suffixes), and 14 lead dual-in-line plastic packages (E suffix).

Features:

- *One standard "B" output will drive eight terminator circuits.*
- *Will terminate a CMOS data bus with up to 40 B-series inputs or 3-state outputs connected at V_{DD} of 5V.*
- *Input terminals protected by standard "B" series ESD protection network.*
- *Preserves final logic state.*
- *Does not consistently go to logic 1 or 0.*
- *Output after switching is closer to V_{DD} or V_{SS} rail than with a resistor.*
- *Requires only one solder connection.*
- *Open circuited terminators not used will not affect performance.*
- *Can be connected to any CMOS I/O line.*
- *Draws only quiescent current when logic state is changing.*
- *Can be preset.*

TRUTH TABLE

Strobe	Data	1A (B)	2A (B)	3A (B)	4A (B)
1	0	0	0	0	0
1	1	1	1	1	1
0	X	*	*	*	*

1 = high, 0 = low, X = Don't Care

*Terminator retains last data state during strobe if its inputs are in high Z state. If inputs are not in high Z state, then terminator follows the last driver state, (1 or 0) on its input/output.

CD22100 Types

CMOS 4 x 4 Crosspoint Switch with Control Memory

The RCA-CD22100 combines a 4 x 4 array of crosspoints (transmission gates) with a 4-line-to-16-line decoder and 16 latch circuits. Any one of the sixteen transmission gates (crosspoints) can be selected by applying the appropriate four line address. The selected transmission gate can be turned on or off by applying a logical one or zero, respectively, to the data input and strobing the strobe input to a logical one. Any number of the transmission gates can be ON simultaneously. When the device is "powered up", the states of the 16 switches are indeterminate. Therefore, all switches must be turned off by putting the strobe high and data-in low, then addressing all switches in succession.

The CD22100 is supplied in 16-lead hermetic dual-in-line ceramic packages (D and F suffixes), 16-lead dual-in-line plastic packages (E suffix), and in chip form (H suffix).

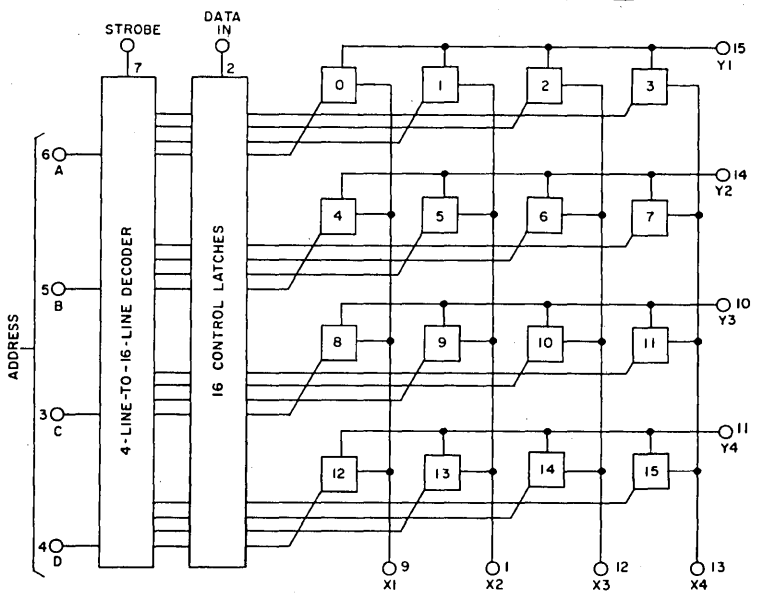

Fig. 1 – Functional diagram.

92CM-27346R1

Features:

- Low ON resistance – 75 Ω typ. at V_{DD} = 12 V
- "Built-in" control latches
- Large analog signal capability – ± $V_{DD}/2$
- 10-MHz switch bandwidth
- Matched switch characteristics ΔR_{ON} = 18Ω typ. at V_{DD} = 12 V
- High linearity – 0.5% distortion (typ.) at f = 1 kHz, V_{IN} = 5 V_{p-p}, V_{DD} = 10 V, and R_L = 1 kΩ
- Standard COS/MOS noise immunity
- 100% tested for maximum quiescent current at 20 V

CD22101, CD22102 Types

CMOS 4 x 4 x 2 Crosspoint Switches With Control Memory

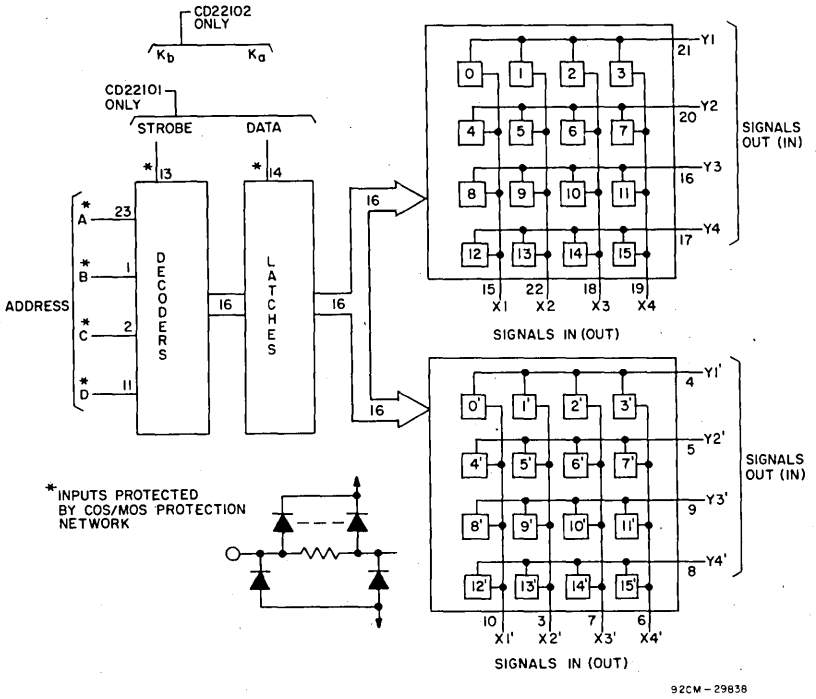

Fig. 1 — Functional block diagram.

Features:

- **Low ON resistance — 75 Ω typ. at V_{DD} + 12 V**
- **"Built-in" latched inputs**
- **Large analog signal capability — ± $V_{DD}/2$**
- **10 MHz switch bandwidth**
- **Matched switch characteristics ΔR_{ON} = 8 Ω typ. at V_{DD} = 12 V**
- **High linearity — 0.25% distortion (typ.) at f = 1 kHz, $V_{IN} = 5V_{p-p}$, $V_{DD} - V_{SS}$ = 10 V, and R_l = 1 kΩ**
- **Standard COS/MOS noise immunity**

Applications:

- **Telephone systems**
- **PBX**
- **Studio audio switching**
- **Multisystem bus interconnect**

The RCA-CD22101 and CD22102 crosspoint switches consist of 4 x 4 x 2 arrays of crosspoints (transmission gates), 4-line to 16-line decoders, and 16 latch circuits. Any one of the sixteen crosspoint pairs can be selected by applying the appropriate four-line address, and any number of crosspoints can be ON simultaneously. Corresponding crosspoints in each array are turned on and off simultaneously, also.

In the CD22101, the selected crosspoint pair can be turned on or off by applying a logical ONE or ZERO, respectively, to the data input, and applying a ONE to the strobe input. When the device is "powered up", the states of the 16 switches are indeterminate. Therefore, all switches must be turned off by putting the strobe high, data-in low, and then addressing all switches in succession.

The selected pair of crosspoints in the CD22102 is turned on by applying a logical ONE to the K_a (set) input while a logical ZERO is on the K_b input, and turned off by applying a logical ONE to the K_b (reset) input while a logical ZERO is on the K_a input. In this respect, the control latches of the CD22102 are similar to SET/RESET flip-flops. They differ, however, in that the simultaneous application of ONEs to the K_a and K_b inputs turns off (resets) all crosspoints. All crosspoints in both devices must be turned off as V_{DD} is applied.

The CD22101 and CD22102 types are supplied in 24-lead hermetic dual-in-line ceramic packages (D and F suffixes), 24-lead dual-in-line plastic packages (E suffix), and in chip form (H suffix).

RECOMMENDED OPERATING CONDITIONS

For maximum reliability, nominal operating conditions should be selected so that operation is always within the following ranges:

CD22103

Preliminary Data

COS/MOS HDB3 (High Density Bipolar 3) Transcoder for 2.048 Mb/s Transmission Applications

Features:

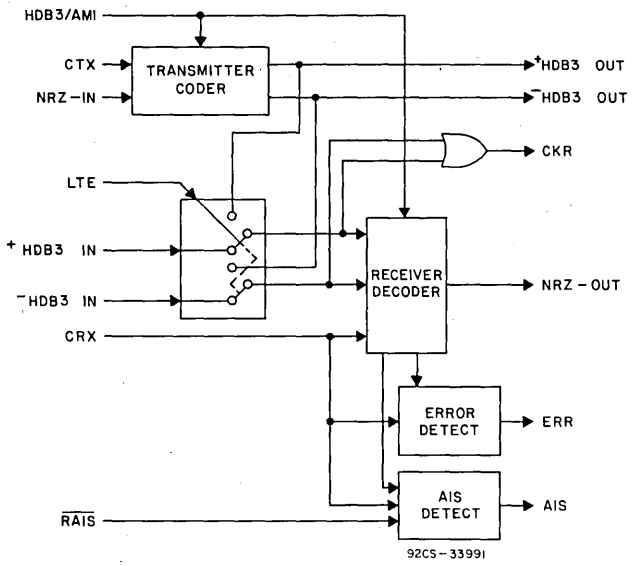
- *HDB3 coding and decoding for data rates from 10 Kb/s to 2.1 Mb/s in a manner consistent with CCITT 6703 recommendations.*
- *HDB3/AMI transmission coding/reception decoding with code error detection is performed in independent coder and decoder sections.*
- *All transmitter and receiver inputs/outputs are TTL compatible.*
- *Internal Loop Test capability.*

The RCA CD22103 is an LSI SOS integrated circuit which performs the HDB3 transmission coding and reception decoding functions with error detection. It is used in 2.048 Mb/s transmission applications. The CD-22103 performs HDB3 coding and decoding for data rates from 10 Kb/s to 2.1 Mb/s in a manner consistent with CCITT G703 recommendations.

HDB3 transmission coding/reception decoding with code error detection is performed in independent code and decoder sections. All transmitter and receiver inputs/outputs are TTL compatible.

The HDB3 transmitter coder codes are NRZ binary unipolar input signal (NRZ-In) and a synchronous transmission clock (CTX) into two HDB3 binary unipolar RZ output signals ($^{+}$HDB3 OUT, $^{-}$HDB3 OUT). The TTL compatible output signals $^{+}$HDB3 OUT, $^{-}$HDB3 OUT are externally mixed to generate ternary bipolar HDB3 signals for driving transmission lines.

HDB3 reception decoding is performed on ternary bipolar HBD3 signals which have been externally split to provide binary unipolar receiver input signals, ($^{+}$HDB3 IN, $^{-}$HDB3 IN), and a synchronous receiver clock signal, (CRX) into binary unipolar NRZ signals (NRZ - Out).



Block diagram of the CD22103.

CD22301

PCM Line Repeater

Preliminary Data

Features:

- *Automatic line buildout*
- *5.1 V supply voltage*
- *Buffered output*

Applications:

- *T1 1.544 Mbits/s bipolar carrier system*
- *T148 2.37 Mbits/s ternary carrier system*

The RCA-CD22301 monolithic PCM repeater circuit is designed for T1 carrier systems operating with a bipolar pulse train of 1.544 Mbits/s. It can also be used in the T148 carrier system operating with a ternary pulse train of 2.37 Mbits/s. The circuit operates from a 5.1 V ± 5 % externally regulated supply.

The CD22301 provides active circuitry to perform all functions of signal equalization and amplification, automatic line buildout (ALBO), threshold detection, clock extraction, pulse timing, and buffered output formation.

The CD22301 is supplied in an 18-lead dual-in-line plastic package (E suffix).

CD22859 Types

Preliminary

CMOS Dual-Tone Multifrequency Tone Generator

For Use in Dual-Tone Telephone Dialing Systems

Features

- *Mute drivers on chip*
- *Device power can either be regulated dc or telephone loop current*
- *Use of an inexpensive 3.579545-MHz TV crystal provides high accuracy and stability for all frequencies*

General Description

The RCA-CD22859 is a CMOS dual-tone multifrequency (DTMF) tone generator for use in dual-tone telephone dialing systems. The device can easily be interfaced to a standard pushbutton telephone keyboard, to provide enabling operation directly with the telephone lines.

The CD22859 generates standard DTMF sinusoidal dialing tones from an on-chip reference crystal oscillator. The reference oscillator uses an inexpensive 3.579545-MHz color TV crystal to create highly stable and accurate tones. The sinusoidal tones are digitally synthesized by a stair-step approximation.

One of four low-frequency band row tones and one of four high-frequency band column tones are selected by driving one of the four row inputs and one of the four column inputs low. Simultaneous selection of more than one row input and/or more than one column input will inhibit tone generation, or generate a single-tone sinusoid. These operating modes are described in the functional truth table.

Control logic is included to allow easy interface to standard K500-type telephones. Two CMOS outputs Tx, Rx, capable of driving external p-n-p receiver and transmitter muting transistors are provided. A low input to the CD pin, inhibits tone generation, turns off the reference oscillator, and causes Tx and Rx outputs to logic '0'. During tone generation mode, $\overline{CD} = 1$ and Tx, Rx = logic 1.

All row, column, and $\overline{CD}$ inputs are provided with pull-up resistors to allow the use of SPST switch matrixes.

The CD22859 types are supplied in a 16-lead hermetic dual-in-line side-brazed ceramic package (D suffix), and a 16-lead dual-in-line plastic package (E suffix), and in chip form (H suffix).

I_{OL} (Sink)	10	2.5	—	10	μA

*Two or more row inputs low, and one column input low.

**Two or more column inputs low, and one row input low.

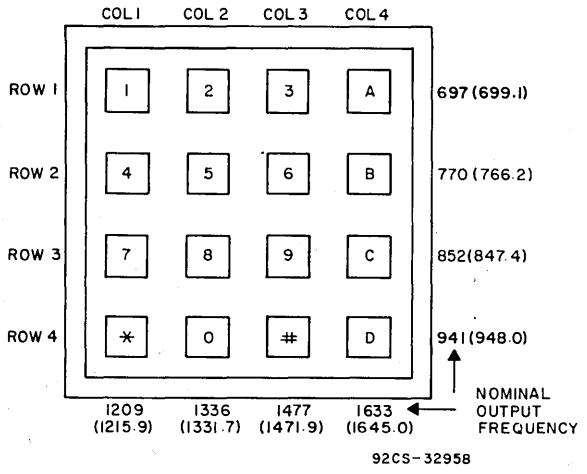
Notes:

1. Distortion is defined as: The ratio of all extraneous frequency components generated in the voiceband 0.5 kHz to 3 kHz, to the power of the dual-tone signal, measure across R_L.

$$= \frac{(V_1^2 + V_2^2 = \ldots + V_n^2)}{V_L^2 + V_H^2}$$

where $V_1, V_2, \ldots V_n$ are extraneous frequency components in the voiceband 0.5 kHz to 3 kHz, V_L is the low-band frequency tone, and V_H is the high-band frequency tone.

2. Tone rise time is defined as the time for each of the 2 DTMF frequencies to attain 90% of full amplitude, measured from the time when a row and column signal are driven low.
3. Pre-emphasis is the ratio of the high-group level to the low-group level.
4. Refer to Fig. 1 for standard DTMF frequencies.



Bell and nominal output frequencies (in parenthesis) for 3.579545-MHz crystal.

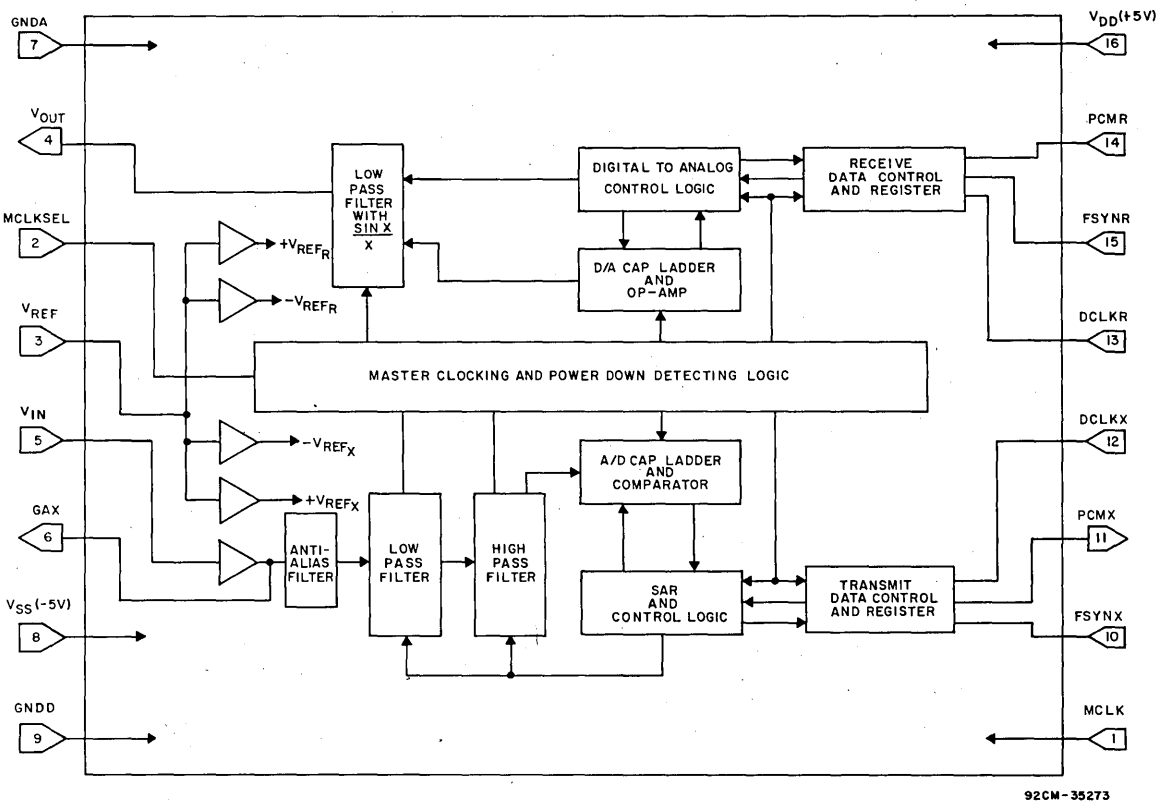
CD22302 Objective Data
Combined PCM CODEC/Filter Chip

Features:

- 16-pin device
- COder and DECoder with PCM receive and transmit filters in one package
- ±5V DC operation
- Anti-aliasing filter
- Sin x/x correction for the receive low pass filter
- On-chip auto-zero circuitry
- TTL compatibility
- Synchronous or Asynchronous operation
- Master clock select control
  1.536 MHz
  1.544 MHz
  2.048 MHz
- Variable data rates: 64 kHz to 3.56 MHz
- Meets or exceeds D3/D4 channel bank and CCITT specifications
- A-law or μ-law metal option
- Separate analog and digital grounds
- Variable external single voltage reference 2.5V-3.16V
- Low power dissipation:
  Operating - 60 mW typical
  Power-down mode ≤2mW



Functional Block Diagram

SP74SC CMOS LOGIC PRODUCTS

FEATURES

- **Pin-Out and Function compatible to Low Power Schottky Logic.**
- **TTL compatible, interface directly with standard TTL logic levels.**
- **Low quiescent power dissipation.**
- **High Noise Immunity.**
- **All devices have input protective diodes connected to V_{CC} and GND.**

ORDERING INFORMATION

Plastic DIP Package	SP74SCxxxN

ABSOLUTE MAXIMUM RATINGS

Parameter		Min	Max	Units
V_{CC}	DC Supply Voltage	−0.3	7.0	V
V_I, V_O	Input or Output Voltage	−0.3	V_{CC} +0.3	V
T_S	Storage Temperature	−65	+150	°C
P_D	Power Dissipation (Note 1)		500	mW
T_L	Lead Temperature (1/16" from mounting surface for 10 Sec)		+300	°C

Note 1: Derate at 12mW/°C from +45 to +85 C.

CURRENT PRODUCTS

137	Decoder/Demultiplexer 3-to-8 Line Decoders, 3 Enable Inputs and Inverted Outputs with Latches
138	Decoder/Demultiplexer 3-to-8 Line Decoders, 3 Enable Inputs and Inverted Outputs
139	Decoder/Demultiplexer Two independent 2-to-4 Line Decoders with Inverted Outputs
238	Decoder/Demultiplexer 3-to-8 Line Decoders, 3 Enable Inputs with Non-Inverted Outputs
239	Decoder/Demultiplexer Two independent 2-to-4 Line Decoders with Non-Inverted Outputs
240	Octal Buffer/Line Driver Inverting 3-State Outputs
241	Octal Buffer/Line Driver Non-Inverting 3-State Outputs
244	Octal Buffer/Line Driver Non-Inverting 3-State Outputs
245	Octal Bus Transceivers Non-Inverting 3-State Outputs
373	Octal Transparent Latches Non-Inverting 3-State Outputs
374	Octal D-Type Flip-Flops Non-Inverting 3-State Outputs

All devices contain diodes to protect inputs against damage due to high static voltages or electric fields; however, it is advised that precautions be taken not to exceed the max. recommended input voltages. All unused inputs must be connected to an appropriate logic voltage level (either V_{CC} or GND).

540	Octal Buffer/Line Driver Inverting 3-State Outputs

SP74HC SERIES

CMOS LOGIC PRODUCTS

FEATURES

- Utilizes SPI's Selective Oxidation, Silicon-Gate CMOS Process.
- Speed, function and pin-out compatible to 74LS series Logic.
- High Noise Immunity
- Low quiescent power consumption
- Wide power supply range.
- Operates over V_{CC} range of 2.0 to 6.0 Volts.
- Standardized set of Input and Output electrical characteristics.

INPUT

- All devices have Input Protection diodes to V_{CC} and ground.
- All devices have Logic input voltage levels consistent with CMOS

OUTPUT

- The standard output of 74HC devices can source and sink 4mA while devices designed to interface with a Bus system can drive 6mA. Sink and drive capability is guaranteed over −40 to +85°C.
- Symmetric current drive.
- All Outputs are fully buffered.

ORDERING INFORMATION

Plastic DIP Package	SP74HCxxxN

ABSOLUTE MAXIMUM RATINGS

	Parameter	Min	Max	Units
V_{CC}	DC Supply Voltage	−0.5	+7.0	V
V_I, V_O	Input or Output Voltage	−0.5	V_{CC} +0.5	V

ECL LOGIC SELECTION GUIDE 10K/100K

Signetics is big in ECL. Big in product breadth and superb in quality and reliability. We're also big in ECL inventory — which means most of the parts listed below are readily available from your local Signetics sales office or authorized distributor.

If you're already using ECL, you know full well that its high operating speed is the most direct way to improve system performance. The 10K series has established itself as "the logical choice" for designing high-speed CPUs and digital communications systems. Its 200 MHz operating speed and 2.0 nsec gate delay have also made 10K ECL increasingly popular for designing computers, peripherals, and instrumentation. Signetics' 10K offering represents more than 90% of the devices currently recognized as industry standards.

We're not only committed to being your best source for 10K. We also aim to be the leading supplier of the faster 100K series. Our 100K parts — with a 750 picosecond gate delay and an operating speed in the 400-500 MHz range — will let you boost your system performance even further.

Our 10K ICs automatically go through the rigors of our SUPR IIA program (Signetics Upgraded Product Reliability) — at no extra charge. For further testing which has proved to minimize board reworks and cut field repairs, you'll be interested in our SUPR IIB burn-in. This optional screening is available at a nominal cost adder per device.

10K ECL PERFORMANCE REVIEW

The high-speed performance attributes of the 10K series are being demonstrated today in a host of data processing applications. The 10K parts provide an ideal speed-power solution for enhancing the performance of systems previously designed with standard TTL. Compared to standard TTL, the 10K ECL series offers these benefits:

- Smaller logic swings: 600 mV vs. 4V
- Reduced parts count from complementary outputs
- Significantly faster operating speed
- Versatile drive output with high DC/AC fanout
- Maximum device utilization with Wired-OR outputs
- Reduced noise due to constant supply current
- Low power dissipation

When high speed is essential to your design, 10K ECL may be the answer. Signetics has more than 60 answers in its 10K ECL family.

10K AVAILABLE IN PLASTIC DIP AND CERDIP PACKAGES

Type	Function
	Gates
10100	quadruple 3-input NOR gate (1 input common)
10101	quadruple 2-input OR/NOR gate (1 input common)
10102	quadruple 2-input, 3 NOR and 1 OR/NOR gate
10103	quadruple 2-input, 3 OR and 1 OR/NOR gate
10104	quadruple 2-input, 3 AND and 1 AND/NAND gate
10105	triple 2-3-2 input OR/NOR gate
10106	triple 4-3-3 input NOR gate
10107	triple 2-input EXCLUSIVE-OR/EXCLUSIVE-NOR gate
10108	dual 3-input AND/NAND gate
10109	dual 4-5 input OR/NOR gate
10110	dual 3-input/3-output OR gate (line driver)
10111	dual 3-input/3-output NOR gate (line driver)
10113	quadruple EXCLUSIVE-OR gate (with enable)
10117	dual 2-wide 2-3 input OR-AND/OR-AND-INVERT gate
10118	dual 2-wide 3-input OR-AND gate
10119	4-wide 4-3-3-3 input OR-AND gate
10121	4-wide OR-AND/OR-AND-INVERT gate
10210	high speed dual 3-input/3-output OR gate
10211	high speed dual 3-input/3-output NOR gate
10216	triple differential OR/NOR line receiver (high speed)
	Interfaces
10112	dual 3-input/3-output (1 OR and 2 NOR) line driver
10114	triple line receiver
10115	quadruple line receiver
10116	triple line receiver
10123	triple 4-3-3 input bus driver
10124	quadruple TTL to ECL translator
10125	quadruple ECL to TTL translator
10129	quadruple TTL/IBM bus receiver/latch
10188	hex buffer (non-inverting)
10189	hex inverter
10192	quad differential line driver
	Flip-Flops
10130	dual D-type latch
10131	dual D-type master-slave flip-flop
10133	quadruple latch with D-type inputs and enable outputs
10135	dual JK master-slave flip-flop
10175	quint D-latch common reset and two wired-OR common clock inputs
10176	hex D-type master-slave flip-flop
10231	high speed dual D-type master-slave flip-flop

Type	Function
	Counters & Registers
10136	universal hexadecimal counter
10137	universal decade counter
10141	4-bit universal shift register
	Complex
10132	dual 2-input multiplexer with clocked D-type latches and common reset
10134	dual 2-input multiplexer with clocked D-type latches
10158	quadruple 2-to-1 multiplexer (non-inverting)
10159	quadruple 2-to-1 multiplexer (inverting)
10160	12-bit parity checker/generator
10161	3-bit decoder with two enable inputs (1 of 8 lines LOW)
10162	3-bit decoder with two enable inputs (1 of 8 lines HIGH)
10164	8-input multiplexer with enable input
10165	8-input priority encoder
10171	dual 2-bit decoder (1 of 4 lines LOW)
10172	dual 2-bit decoder (1 of 4 lines HIGH)
10173	quadruple 2-input multiplexer with latched outputs
10174	dual 4-to-1 multiplexer (with enable)
10179	look-ahead carry block
10180	dual 2-bit adder/subtractor
10181	4-bit arithmetic logic unit
10191	hex ECL-MST translator
	Memories
10149	1024-bit, 4-bits per word PROM
10155	16-bit, 2-bits per word CAM (content addressable memory)
10415	1024-bit, 1-bit per word RAM

ECL LOGIC SELECTION GUIDE 10K/100K

SPECIFY 100K FOR INDUSTRY'S FASTEST LOGIC

With sub-nanosecond propagation gate delay, our growing family of 100K deserves serious consideration for the design of your next high-speed system.

Signetics' 100K devices are specified to operate from a single −4.5V supply. However, they can be internally compensated to operate over a wider voltage range.

Specify our 100K — and you can rest assured that the performance characteristics on the lab bench will also prevail in different application environments. That means you'll spend less time estimating all possible extremes of temperature and supply voltage that your system will endure — and the ultimate effects of these variables on component performance.

Signetics' 100K ECL. Your logical choice for the fastest standard logic. Put 100K switching rates to work in your design — and realize superior system performance.

100K AVAILABLE IN SLIMDIP AND FLATPAK PACKAGES

Type	Function	Availability

THE HIGH-SPEED LOGIC OF THE 80'S — 54/74F FAST TTL

PRODUCT DESCRIPTION

Signetics has combined advanced oxide-isolated fabrication techniques with standard TTL functions to create a new family designed for the 80's. The high operating speeds of FAST can push system operating speeds into areas previously reserved for 10K ECL, but with simple TTL design rules and single 5V power supplies. Low input loading allows the user to mix LS, ALS,and HCMOS in the same system without the need for translators and restrictive fanout requirements.

FAST circuits are pin-for-pin replacements for 74S types, but offer power dissipation 3-4 times lower and higher operating speeds. Existing systems can achieve much lower power by replacing the 74S types with the corresponding FAST devices, with no changes other than reducing the size of the power supply.

The input structure provides better noise immunity because of higher thresholds, while the oxide-isolation and new circuit techniques create devices that have less variation with temperature or supply voltage than existing TTL logic families. Signetics guarantees all ac parameters under realistic system conditions—across the supply voltage spread and the temperature range, and with heavy 50pF output loads.

The use of high-capacitance PNP inputs has been avoided, and clamping diodes have been added to both the inputs and outputs to prevent negative overshoots. High input breakdown voltages allow unused inputs to be tied directly to V_{CC} without pullup resistors.

Multiple sources and a complete family of powerful circuits combine to make Signetics FAST the logic choice of the 80's!

FEATURES

- **3ns propagation delays**
- **4mW/gate power dissipation**
- **Guaranteed AC performance over temperature and supply voltage spreads**
- **Improved input and output structures**
- **Standard TTL functions and pinouts**
- **Replacement for "S" types . . . 1/4 the power**
- **Designer's choice for new system designs**

ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted.)

PARAMETER		54F	74F	UNIT
V_{CC}	Supply voltage	7.0	7.0	V
V_{IN}	Input voltage	−0.5 to +7.0	−0.5 to +7.0	V
I_{IN}	Input current	−30 to +5	−30 to +5	mA
V_{OUT}	Voltage applied to output in HIGH output state	−0.5 to +V_{CC}	−0.5 to +V_{CC}	V
T_A	Operating free-air temperature range	−55 to +125	0 to 70	°C

RECOMMENDED OPERATING CONDITIONS

PARAMETER			54/74F			UNIT
			Min	Nom	Max	
V_{CC}	Supply voltage	Mil	4.5	5.0	5.5	V
		Com'l	4.75	5.0	5.25	V
V_{IH}	HIGH-level input voltage		2.0			V
V_{IL}	LOW-level input voltage				+0.8	V
I_{IK}	Input clamp current				−18	mA
I_{OH}	HIGH-level output current	Std.			−1.0	mA
		Buffer			−3.0	mA
I_{OL}	LOW-level output current	Std.			20	mA
		Buffer (Com'l)			64	mA
T_A	Operating free-air temperature	Mil	−55		+125	°C
		Com'l	0		70	°C

DC ELECTRICAL CHARACTERISTICS (Over recommended operating free-air temperature range unless otherwise noted.)

PARAMETER		TEST CONDITIONS[1]		54/74F			UNIT
				Min	Typ[2]	Max	
V_{OH}	HIGH-level output voltage	V_{CC} = MIN, V_{IH} = MIN, V_{IL} = 0.5V, I_{OH} = MAX		2.0			V
		V_{CC} = MIN, V_{IH} = MIN, V_{IL} = MAX, I_{OH} = −1mA	Mil	2.5	3.4		V
			Com'l	2.7	3.4		V
V_{OL}	LOW-level output voltage	V_{CC} = MIN, V_{IH} = MIN, V_{IL} = MAX, I_{OL} = MAX	Std.		0.35	0.5	V
			Buffer			0.55	V
V_{IK}	Input clamp voltage	V_{CC} = MIN, I_I = I_{IK}				−1.2	V
I_I	Input current at maximum input voltage	V_{CC} = MAX, V_I = 7.0V				0.1	mA
I_{IH}	HIGH-level input current	V_{CC} = MAX, V_I = 2.7V				20	μA
I_{IL}	LOW-level input current	V_{CC} = MAX, V_I = 0.5V				−0.6	mA
I_{OS}	Short-circuit output current[3]	V_{CC} = MAX	Std.	−60		−150	mA
			Buffer	−100		−225	mA

NOTES:
1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX + 0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.

TRANSCEIVER 54/74LS245

Octal Transceiver (3-State)

- **Octal bidirectional bus interface**
- **3-State buffer outputs**
- **PNP inputs for reduced loading**
- **Hysteresis on all inputs**

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (Total)
74LS245	8ns	58mA

DESCRIPTION

The 'LS245 is an octal transceiver featuring non-inverting 3-State bus compatible outputs in both send and receive directions. The outputs are all capable of sinking 24mA and sourcing up to 15mA, producing very good capacitive drive characteristics. The device features a Chip Enable (CE) input for easy cascading and a Send/Receive (S/R) input for direction control. All inputs have hysteresis built in to minimize ac noise effects.

DESCRIPTION

The '373 is an octal transparent latch coupled to eight 3-State output buffers. The two sections of the device are controlled independently by Latch Enable (E) and Output Enable ($\overline{OE}$) control gates.

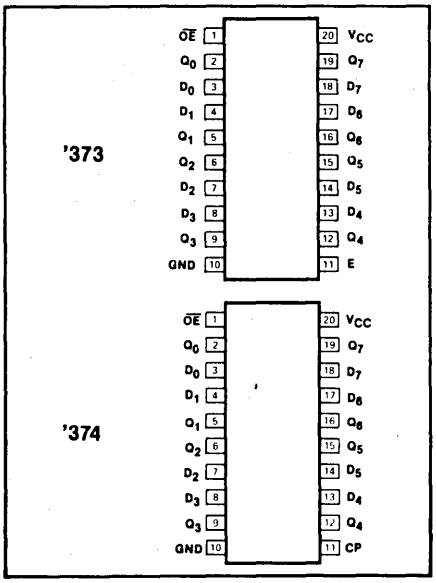
The data on the D inputs are transferred to the latch outputs when the Latch Enable (E) input is HIGH. The latch remains transparent to the data inputs while E is HIGH, and stores the data present one setup time before the HIGH-to-LOW enable transition. The enable gate has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the latching operation.

The 3-State output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The active LOW Output Enable ($\overline{OE}$) controls all eight 3-State buffers independent of the latch operation. When $\overline{OE}$ is LOW, the latched or transparent data appears at the outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

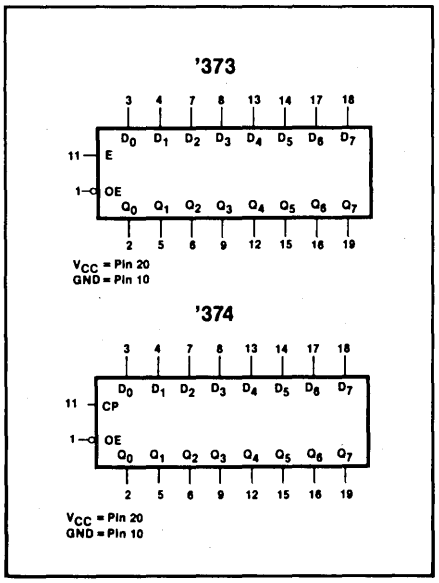
The '374 is an 8-bit, edge-triggered register coupled to eight 3-State output buffers. The two sections of the device are controlled independently by the Clock (CP) and Output Enable ($\overline{OE}$) control gates.

The register is fully edge triggered. The state of each D input, one setup time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's Q output. The clock buffer has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the clocking operation.

PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)

FLIP-FLOP 54/74S534

Octal D Flip-Flop With 3-State Outputs

- 8-bit positive, edge-triggered register
- Inverting outputs
- 3-State output buffers
- Common 3-State Output Enable
- Independent register and 3-State buffer operation

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (Total)
74S534	8ns	116mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGES V_{CC} = 5V ±5%; T_A = 0°C to +70°C	MILITARY RANGES V_{CC} = 5V ±10%; T_A = −55°C to +125°C
Plastic DIP	N74S534N	
Ceramic DIP	N74S534F	S54S534F

DESCRIPTION

The '534 is an 8-bit, edge-triggered register coupled to eight 3-State inverting output buffers. The two sections of the device are controlled independently by the Clock (CP) and Output Enable ($\overline{OE}$) control gates.

The register is fully edge triggered. The state of each D input, one setup time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's $\overline{Q}$ output. The clock buffer has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the clocking operation.

The 3-State inverting output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The active LOW Output Enable ($\overline{OE}$) controls all eight 3-State buffers independent of the register operation. When $\overline{OE}$ is LOW, the data in the register appears at the outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	8TS
All	Inputs	1Sul
All	Outputs	10Sul

NOTE
An 8TS unit load (Sul) is 50μA I_{IH} and −2.0mA I_{IL}.

DESCRIPTION

The 8TS805 is an octal, transparent latch coupled to eight 3-State output buffers. The two sections of the device are controlled independently by Latch Enable (E) and Output Enable ($\overline{OE}$) control gates.

The data on the D inputs are transferred to the latch outputs when the Latch Enable (E) input is HIGH. The latch remains transparent to the data inputs while E is HIGH, and stores the data present one setup time before the HIGH-to-LOW enable transition. The enable gate has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the latching operation.

The 3-State output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The active LOW Output Enable ($\overline{OE}$) controls all eight 3-State buffers independent of the latch operation. When $\overline{OE}$ is LOW, the latched or transparent data appears at the outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

The 8TS806 is an 8-bit, edge-triggered register coupled to eight 3-State output buffers. The two sections of the device are controlled independently by the Clock (CP) and Output Enable ($\overline{OE}$) control gates.

The register is fully edge triggered. The state of each D input, one setup time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's Q output. The clock buffer has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the clocking operation.

ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted.)

PARAMETER		S8TS	N8TS	UNIT
V_{CC}	Supply voltage	7.0	7.0	V
V_{IN}	Input voltage	−0.5 to +5.5	−0.5 to +5.5	V
I_{IN}	Input current	−30 to +5	−30 to +5	mA
V_{OUT}	Voltage applied to output in HIGH output state	−0.5 to +V_{CC}	−0.5 to +V_{CC}	V
T_A	Operating free-air temperature range	−55 to +125	0 to 70	°C

RECOMMENDED OPERATING CONDITIONS

PARAMETER			8TS			UNIT
			Min	Nom	Max	
V_{CC}	Supply voltage	Mil	4.5	5.0	5.5	V
		Com'l	4.75	5.0	5.25	V
V_{IH}	HIGH-level input voltage		2.0			V
V_{IL}	LOW-level input voltage	Mil			+0.8	V
		Com'l			+0.8	V
I_{IK}	Input clamp current				−18	mA
I_{OH}	HIGH-level output current	Mil			−2.0	mA
		Com'l			−6.5	mA
I_{OL}	LOW-level output current	Mil			20	mA
		Com'l			20	mA
T_A	Operating free-air temperature	Mil	−55		+125	°C
		Com'l	0		70	°C

NOTE
V_{IL} = +0.7V MAX for S8TS at T_A = +125°C only.

DC ELECTRICAL CHARACTERISTICS (Over recommended operating free-air temperature range unless otherwise noted.)

PARAMETER		TEST CONDITIONS[1]			8TS807, 808			UNIT
					Min	Typ[2]	Max	
V_{OH}	HIGH-level output voltage	V_{CC} = MIN, V_{IH} = MIN, V_{IL} = MAX, I_{OH} = MAX		Mil	2.4	3.0		V
				Com'l	2.4	3.1		V
V_{OL}	LOW-level output voltage	V_{CC} = MIN, V_{IH} = MIN, V_{IL} = MAX	I_{OL} = MAX	Mil			0.5[4]	V
				Com'l			0.5	V
V_{IK}	Input clamp voltage	V_{CC} = MIN, I_I = I_{IK}					−1.2	V
I_{OZH}	Off-state output current, HIGH-level voltage applied	V_{CC} = MAX, V_{IH} = MIN, V_O = 2.4V					50	μA
I_{OZL}	Off-state output current, LOW-level voltage applied	V_{CC} = MAX, V_{IH} = MIN, V_O = 0.5V					−50	μA
I_I	Input current at maximum input voltage	V_{CC} = MAX, V_I = 5.5V					1.0	mA
I_{IH}	HIGH-level input current	V_{CC} = MAX, V_I = 2.7V					50	μA
I_{IL}	LOW-level input current	V_{CC} = MAX, V_I = 0.5V					−0.25	mA
I_{OS}	Short-circuit output current[3]	V_{CC} = MAX			−40		−100	mA
I_{CC}	Supply current (total)	V_{CC} = MAX	I_{CCL}	8TS807		105	160	mA
			I_{CCL}	All inputs grounded, 8TS808		102	140	mA
			I_{CCZ}	CP, $\overline{OE}$ = 4.0V, D inputs = GND, 8TS807		131	180	mA

NOTES
1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX + 0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.
4. V_{OL} = +0.45V MAX for S8TS at T_A = +125°C only.

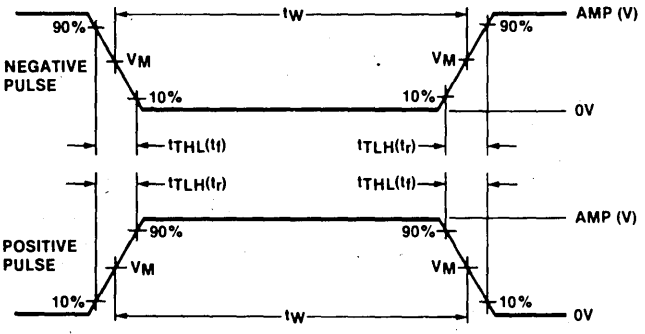
DEFINITIONS

R_L = Load resistor to V_{CC}; see AC CHARACTERISTICS for value.
C_L = Load capacitance includes jig and probe capacitance; see AC CHARACTERISTICS for value.
R_T = Termination resistance should be equal to Z_{OUT} of Pulse Generators.
D = Diodes are 1N916, 1N3064, or equivalent.
R_X = 1kΩ for 54/74, 54S/74S, R_X = 5kΩ for 54LS/74LS.
t_{TLH}, t_{THL} Values should be less than or equal to the table entries.

INPUT PULSE DEFINITIONS



V_M = 1.3V for 54LS/74LS; V_M = 1.5V for all other TTL families.

FAMILY	INPUT PULSE REQUIREMENTS Amplitude	Rep. Rate	Pulse Width	t_{TLH}	t_{THL}
8TS	3.0V	1MHz	500ns	2.5ns	2.5ns

LOCMOS

Signetics Now Offers the Entire Philips IC Product Line.

HE4000B Family

The LOCMOS HE4000B range is a fully buffered digital integrated circuit family which meets the JEDEC-B specification. The members of this family are plug-in replacements for the well-known C-MOS 4000 and 14500 ranges. The HE family has the same advantages as conventional C-MOS circuits, plus the additional LOCMOS advantages. Recommended supply voltage range 3 to 15V.

LOCMOS means Local Oxidation Complementary MOS.

Inputs and outputs are protected against electrostatic effects in a wide variety of device-handling situations. However, to be totally safe, it is desirable to take handling precautions into account.

The HE family is designed with standardized output drive characteristics which, combined with relative intensity to output capacitance loading, simplify system design.

Advantages of LOCMOS

- Low power dissipation — typically 10nW per gate (static)
- Wide operating supply voltage range
- Wide operating temperature range from −40 to +85°C
- High d.c. fan-out
- Inputs and outputs are protected against electrostatic voltages

In addition to these, the LOCMOS HE4000B range has:

- Buffered outputs on **all** circuits
- Higher speed
- Higher packing density—essential for MSI/LSI
- Excellent noise immunity

We currently offer 121 types (most 14 and 16 pin devices) in S.O. package with additional types planned for the future (20, 24, 28 pin devices).

Product Range

NAND Gates

HEF4011B	Quadruple 2-Input NAND Gate
HEF4011UB	Quadruple 2-Input NAND Gate
HEF4012B	Dual 4-Input NAND Gate
HEF4023B	Triple 3-Input NAND Gate
HEF4068B	8-Input NAND Gate

AND Gates

HEF4073B	Triple 3-Input AND Gate
HEF4081B	Quadruple 2-Input AND Gate
HEF4082B	Dual 4-Input AND Gate

NOR Gates

HEF4000B	Dual 3-Input NOR Gate and Inverter
HEF4001B	Quadruple 2-Input NOR Gate
HEF4001UB	Quadruple 2-Input NOR Gate
HEF4002B	Dual 4-Input NOR Gate
HEF4025B	Triple 3-Input NOR Gate
HEF4078B	8-Input NOR Gate

OR Gates

HEF4071B	Quadruple 2-Input OR Gate
HEF4072B	Dual 4-Input OR Gate
HEF4075B	Triple 3-Input OR Gate

Inverters and Buffers

HEF4007UB	Dual Complementary Pair and Inverter
HEF4041B	Quadruple True/Complement Buffer
HEF4049B	Hex Inverting Buffers
HEF4050B	Hex Non-Inverting Buffers
HEF4069UB	Hex Inverter
HEF4502B	Strobed Hex Inverter/Buffer
HEF40097B	3-State Hex Non-Inverting Buffer
HEF40098B	3-State Hex Inverting Buffer
HEF40240B	Octal Inverting Buffers with 3-State Outputs
HEF40244B	Octal Buffer with 3-State Outputs

Complex Gates

HEF4030B	Quadruple EXCLUSIVE-OR Gate
HEF4070B	Quadruple EXCLUSIVE-OR Gate
HEF4077B	Quadruple EXCLUSIVE-OR Gate
HEF4085B	Dual 2-Wide 2-Input AND-OR-Invert Gate
HEF4086B	4-Wide 2-Input AND-OR-Invert Gate

Flip-Flops

HEF4013B	Dual D-Type Flip-Flop
HEF4027B	Dual JK Flip-Flop
HEF4076B	Quadruple D-Type Flip-Flop with 3-State Outputs
HEF40174B	Hex D-Type Flip-Flop
HEF40175B	Quadruple D-Type Flip-Flop
HEF40374B	Octal D-Type Flip-Flop with 3-State Outputs

Schmitt Triggers

HEF4093B	Quadruple 2-Input NAND Schmitt Trigger
HEF40106B	Hex Schmitt Trigger

Special Functions

HEF4046B	Phase-Locked Loop
HEF4104B	Quadruple Low-to-High Voltage Translator with 3-State Outputs
HEF4527B	BCD Rate Multiplier
HEF4738V	IEC/IEEE Bus Interface
HEF4739V	Digital Voltmeter Circuit
HEF4750V	Frequency Divider
HEF4752V	a.c. Motor Control Circuit
HEF4755V	Transceiver for Serial Data Communication
HEF40245B	Octal Bus Transceiver with 3-State Outputs

Counters

HEF4017B	5-State Johnson Counter
HEF4018B	Presettable Divide-by-n Counter
HEF4020B	14-Stage Binary Counter
HEF4022B	4-Stage Divide-by-8 Johnson Counter
HEF4024B	7-Stage Binary Counter
HEF4029B	Synchronous Up/Down Counter, Binary/ Decade Counter
HEF4040B	12-Stage Binary Counter
HEF4059B	Programmable Divide-by-n Counter
HEF4060B	14-Stage Ripple-Carry Binary Counter/ Divider and Oscillator
HEF4510B	BCD Up/Down Counter
HEF4516B	Binary Up/Down Counter
HEF4518B	Dual BCD Up Counter
HEF4520B	Dual Binary Counter
HEF4521B	24-Stage Frequency Divider
HEF4522B	Programmable 4-Bit BCD Down Counter
HEF4526B	Programmable 4-Bit Binary Down Counter
HEF4534B	Real Time 5-Decade Counter
HEF4737B/V	Quadruple Static Decade Counters
HEF4751V	Universal Divider
HEF40160B	4-Bit Synchronous Decade Counter with Asynchronous Reset
HEF40161B	4-Bit Synchronous Binary Counter with Asynchronous Reset
HEF40162B	4-Bit Synchronous Decade Counter with Synchronous Reset
HEF40163B	4-Bit Synchronous Binary Counter with Synchronous REset
HEF40192B	4-Bit Up/Down Decade Counter
HEF40193B	4-Bit Up/Down Binary Counter

Registers

HEF4006B	18-Stage Static Shift Register
HEF4014B	8-Bit Static Shift Register

Product Range (Continued)

HEF4015B Dual 4-Bit Static Shift Register
HEF4021B 8-Bit Static Shift Register
HEF4031B 64-Stage Static Shift Register
HEF4035B 4-Bit Universal Shift Register
HEF4094B 8-Stage Shift-and-Store Bus Register
HEF4517B Dual 64-Bit Static Shift Register
HEF4557B 1-to-64-Bit Variable Length Shift Register
HEF4731B/V Quadruple 64-Bit Static Shift Registers
HEF40194B 4-Bit Bidirectional Universal Shift Register
HEF40195B 4-Bit Universal Shift Register

Digital Multiplexers

HEF4019B Quadruple 2-Input Multiplexer
HEF4512B 8-Input Multiplexer with 3-State Output
HEF4519B Quadruple 2-Input Multiplexer
HEF4539B Dual 4-Input Multiplexer

Decoders and Demultiplexers

HEF4028B 1-of-10 Decoder
HEF4511B BCD to 7-Segment Latch/Decoder/Driver
HEF4514B 1-of-16 Decoder/Demultiplexer with Input Latches
HEF4515B 1-of-16 Decoder/Demultiplexer with Input Latches
HEF4543B BCD to 7-Segment Latch/Decoder Driver for Liquid Crystal and LED Displays
HEF4555B Dual 1-of-4 Decoder/Demultiplexer
HEF4556B Dual 1-of-4 Decoder/Demultiplexer

Analog Switches and Multiplexers/Demultiplexers

HEF4016B Quadruple Bilateral Switches
HEF4051B 8-Channel Analog Multiplexer/ Demultiplexer
HEF4052B Dual 4-Channel Analog Multiplexer/ Demultiplexer
HEF4053B Triple 2-Channel Analog Multiplexer/ Demultiplexer
HEF4066B Quadruple Bilateral Switches
HEF4067B 16-Channel Analog Multiplexer/ Demultiplexer

Latches

HEF4042B Quadruple D-Latch
HEF4043B Quadruple R/S Latch with 3-State Outputs
HEF4044B Quadruple R/S Latch with 3-State Outputs
HEF4508B Dual 4-Bit Latch
HEF4724B 8-Bit Addressable Latch
HEF40373B Octal Transparent Latch with 3-State Outputs

Multivibrators and Timers

HEF4047B Monostable/Astable Multivibrator
HEF4528B Dual Monostable Multivibrator
HEF4538B Dual Precision Monostable Multivibrator
HEF4541B Programmable Timer
HEF4753B Universal Timer Module

Arithmetic Units

HEF4008B 4-Bit Binary Full Adder
HEF4531B 13-Input Parity Checker/Generator
HEf4532B 8-Input Priority Encoder
HEF4585B 4-Bit Magnitude Comparator

Memories

HEF4505B 64-Bit, 1-Bit per Word Random Access Read/Write Memory
HEF4720B/V 256-Bit, 1-Bit per Word Random Access Memories

ORDERING INFORMATION

KEY TO CODE

In the parts selection tables, the following definitions apply:

Prefix Mil/Com Select Military or Commercial part

Base Number Select specific device number

Package Mil/Com Select on Mil/Com package code for device number

JAN Qual
Q1 = Device selected in JAN qualified level 1
M = Device selected is in accordance with MIL-STD-883
F (Q1, M = Q1 and M apply to F package only

Prefix
JB, S, D = −55°C to +125°C (Military)

Package Styles
D = Microminiature SO molded (epoxy)
W = Hermetic flat pack
Y = Flat pack leads extended 4 sides

HOW TO ORDER

Signetics products are available in different packages and temperature ranges. The correct ordering code or part number for the devices is an alphanumeric sequence. All devices are not obtainable in all temperature ranges or all package styles.

Ordering Code Examples

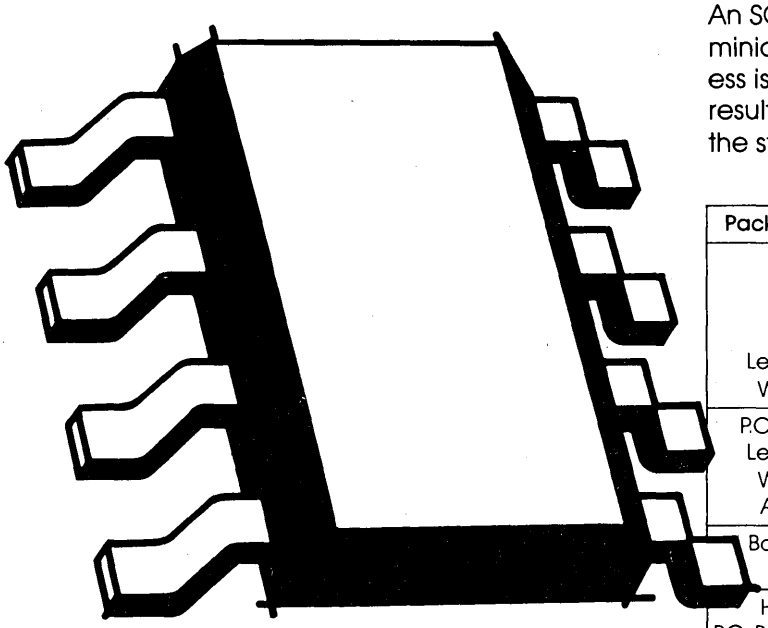
SMALL OUTLINE (SO) PACKAGES

Take a good look at these SO (small outline) packages. They're the smallest plastic DIPs in the world and they could reduce the cost of your system by more than 50%.



SO versus DIP — No Contest!

An SO package is just like a standard DIP, except a miniature lead frame is used. The assembly process is the same as for the standard DIP, but the result is a microminiature package that outshines the standard DIP in every way.

Package Feature	Package Size (Mils)*					
	8 Pin		14 Pin		20 Pin	
	SO	DIP	SO	DIP	SO	DIP
Body Size						
Length (Inches)	.197	.375	.344	.755	.512	1.060
Width (Inches)	.158	.252	.158	.252	.299	.252
P.C. Board Area						
Length (Inches)	.197	.375	.344	.755	.512	1.066
Width (Inches)	.244	.300	.244	.300	.419	.300
Area (Inches^2)	.048	.113	.084	.226	.214	.318
Body Thickness (Inches)	.057	.125	.057	.125	.096	.145
Height Above P.C. Board (Inches)	.069	.160	.069	.160	.104	.180
Weight (Mgs)	60	600	114	1050	500	1500
*16-pin and wide frame 16L-pin versions also available.						

SO Packages Are Surface-Mounted Devices.

The advantages of surface mounting are almost as numerous as those of reduced package size. Because it can be surface mounted, the SO package . . .

- Requires no through hole in the PC board
- Can be wave or reflow soldered using your present equipment
- Can be mounted with traces running underneath it
- Has a low profile allowing boards to be positioned closer together

Our Most Popular Circuits Come In SO Packages.

Over 200 of the more popular logic, linear and CMOS products are available now in SO packages – in 8, 14, 16 and 20-pin packages.

Multipliers

TRW parallel multipliers offer a wide range of word sizes (8 to 24 bits) and speeds to meet requirements in a wide variety of signal processing and computer applications. All devices are TTL compatible. Except as noted, they perform two's complement and unsigned magnitude arithmetic. The MPY112K has been optimized for minimum package size and operation at video processing rates (20 MHz). The MPY1024 will perform the significand multiplication in 32 bit floating point arithmetic, as well as standard fixed point operations.

Product	Size	Multiplication Time* (nsec)	Power Dissipation* (watts)	Package	Extended Temperature Range Available	Available	Notes
MPY008H	8×8	90	1.3	J5, C2	−55°C to 125°C	6/78	Two's complement arithmetic
	8×8	65	1.3	J5, C2	no	6/78	Two's complement arithmetic
MPY08HU	8×8	90	1.3	J5, C2	−55°C to 125°C	11/78	Unsigned magnitude arithmetic
	8×8	65	1.3	J5, C2	no	11/78	Unsigned magnitude arithmetic
MPY012H	12×12	115	3.0	J1, C1, L1	−55°C to 125°C	3/78	
MPY012K	12×12	50	2.5	J1, C1, L1	1Q83	3Q82	
MPY112K	12×12	50	2.2	J4	3Q82	2/82	16 bit product
MPY016H	16×16	145	4.4	J1, C1, L1	−55°C to 125°C	11/77	
MPY16HD	16×16	80	4.0	J1, C1, L1	4Q82	3Q82	
MPY016K	16×16	50	4.0	J1, C1, L1	2Q83	1Q83	
MPY1024	24×24	250	4.0	J1, C1, L1	4Q82	3Q82	
MPY008A**	8×8	170	1.5	J5	−55°C to 125°C	11/76	Two's complement arithmetic
MPY012A**	12×12	200	3.8	J2	−55°C to 125°C	10/76	
MPY016A**	16×16	230	5.0	J2	−55°C to 125°C	10/76	

* Guaranteed, Worst Case, T_A=0°C to 70°C.

**The older "A" series multipliers are available to support ongoing production, but offer no advantage over the "H" and "K" series and are not recommended for new designs.

Multiplier-Accumulators

Multiplier-accumulators perform the sum-of-products operation found in most signal processing algorithms. By imbedding the accumulator adder in the multiplier array, the product and sum are computed in only slightly more time than is required to develop the product alone. The devices will add or subtract the accumulated sum to the new product. Accumulator clearing is accomplished simultaneously with the computation of the first product. The accumulator may be disabled for operation as a multiplier. All devices are TTL compatible.

Product	Size	Multiply-Accumulate Time* (nsec)	Power Dissipation* (watts)	Package	Extended Temperature Range Available	Available	Notes
TDC1008	8×8	100	1.8	J4, C1, L1	−55°C to 125°C	2/78	
TDC1009	12×12	135	3.2	J1, C1, L1	−55°C to 125°C	6/78	
TDC1010	16×16	165	4.7	J1, C1, L1	−55°C to 125°C	3/78	
TDC1003**	12×12	225	4.0	J2	no	8/77	

* Guaranteed, Worst Case, T_A=0°C to 70°C.

**The older TDC1003 is available to support ongoing production, but offers no advantage over the TDC1009 and is not recommended for new designs.

Special Functions

Digital correlators provide a measure of the similarity between two signals. The TDC1004 produces an analog output which is readily summed with other outputs to yield a moderate precision output over a large single- or multi-dimension correlation. The TDC1023 offers a precise digital output with an internal threshold comparison register.

The TDC1022 is the first chip devoted to floating point signal processing. The 16-bit significand and 6-bit exponent provide a dynamic range that is more than sufficient for a majority of DSP applications. This part performs the most difficult floating point operations: add, subtract, normalize, denormalize, limit round, scale, and accumulate. Other floating point circuits are in development.

The TDC1028 is an 8-tap finite impulse response filter that handles 4-bit coefficients, and processes at a 20 MHz data word rate. It is easily expandable in coefficient size, and filter length.

Product	Description	Size	Speed*	Power Dissipation* (watts)	Package	Extended Temperature Range Available	Available	Notes
TDC1022	Floating Point Arithmetic Unit	22 Bit	100 nsec Cycle	2.4	J1, C1, L1	4Q82	3Q82	
TDC1028	FIR Filter	4×4×8	20 MHz	2.0	J4, C1, L1	2Q83	1Q83	
TDC1004	Correlator	64×1	15 MHz	0.7	J9	−55°C to 125°C	8/77	Analog output
TDC1023	Correlator	64×1	15 MHz	1.0	J7, C3	4Q82	8/80	Digital output

* Guaranteed, Worst Case, T_A=0°C to 70°C.

Storage Products

The TDC1005 and TDC1006 are the longest fast (or fastest long) shift registers available. Fully TTL compatible, they are ideal as buffer stores for video rate data. The TDC1030 FIFO is ideal for interconnecting two asynchronous systems.

Product	Description	Size	Clock Rate* (MHz)	Power Dissipation* (watts)	Package	Extended Temperature Range Available	Available	Notes
TDC1005	Shift Register	64×2	25	0.5	J9	−55°C to 125°C	10/77	
TDC1006	Shift Register	256×1	25	0.7	J9	−55°C to 125°C	10/77	
TDC1030	FIFO	64×9	15	1.5	J6	1Q83	3Q82	

* Guaranteed, Worst Case, T_A=0°C to 70°C.

MPY112K
Preliminary Information

VLSI Multiplier
12 × 12 Bits

The MPY112K is a 12 x 12 bit parallel multiplier designed to operate at a 20 MHz video rate. Fabrication of this device using TRW's latest fine-geometry bipolar process offers a three to one improvement in delay-power product over the previously available technology. Multiplication may be performed on two's complement 12 bit operands or on unsigned magnitude 12 bit operands yielding a 16 bit product.

One output and two input registers are provided along with three-state outputs. These registers are positive edge triggered type D flip-flops. The X input is latched by CLK X and the Y input along with the product output is latched by CLK M.

The MPY112K is packaged in a 48 pin DIP for compact size. Applications for the device include real time digital signal processing, use in array processors, and geometric transformations.

Features

- 50 nsec Multiply time Over Commercial Temperature Range
- 12 x 12 Bit Parallel Multiplication With 16 Bit Product Output
- All Inputs And Outputs Are Latched TTL Compatible
- Three-State TTL Output
- Two's Complement Or Unsigned Magnitude Multiplication
- Radiation Hard Bipolar Process
- Single +5V Power Supply
- Ceramic 48 Pin DIP

Applications

- Digital Video Filtering And Real Time Signal Processing
- Image Processing
- Elements In Array Processors
- FFT Calculations
- Geometric Transformations For Graphics Processing

MPY016K
Advance Information

VLSI Multiplier
16 × 16 Bit, 50 nsec

The TRW MPY016K is a 16 × 16 bit VLSI multiplier that operates on a 50-nsec cycle (20 MHz multiplication rate). Individually clocked input and output registers are provided to maximize system throughput and simplify bus interfacing. The Most Significant Product (MSP) and Least Significant Product (LSP) are multiplexed through a dedicated output port, or the LSP can share a bidirectional port with the Y input. Three-state outputs are employed throughout.

Built in TRW's OMICRON-B™ 1-micron bipolar process, the MPY016K is pin-compatible with the industry standard MPY016H and operates with three times the speed at no increase in power dissipation. The MPY016K is the industry's first true video-speed 16-bit multiplier.

Features

- True Video-Speed Performance (20 MHz)
- Double Precision Product
- Includes Input And Output Registers
- Two's Complement, Unsigned Magnitude, Or Mixed Mode Operation
- Output Registers Can Be Made Transparent
- Three-State Outputs
- Pin-Compatible With MPY016H
- Proven Hi-Rel, Rad-Hard Bipolar Process
- Single +5V Power Supply

Applications

- Array Processors
- Video Processors
- Radar Signal Processors
- FFT Processors
- General Digital Signal Processors
- Microcomputer/Minicomputer Accelerators

TDC 1030
Advance Information

First-In First-Out Memory
64 Words by 9 Bits

The TDC1030 is an expandable high speed First-In First-Out (FIFO) memory organized as 64 words by 9 bits. A 20 MHz data rate makes it ideal in applications such as video time base correction, A/D input buffers, input/output formatter for digital filters and FFT's, disk controllers and voice synthesizers.

The Shift In (SI) and Shift Out (SO) controls allow asynchronous data transfers. The Input Ready (IR) flag indicates that the FIFO input stage is empty and available to receive new data. When IR is valid, SI may be asserted, thus loading the data present at D0 through D8 into the FIFO. From this stage, data "falls-through" in an asynchronous manner. The data will stack up at the end of the device while empty locations will "ripple" to the front. Output Ready (OR) indicates that the FIFO output stage contains valid data which may be transferred out via the Shift Out control. Additional control inputs include; Master Reset ($\overline{MR}$) to clear all data within the device and a three-state control signal, Output Enable, ($\overline{OE}$).

Devices can be interconnected to expand in word and bit dimensions. This operation is simplified by the resistive pullups provided at the OR and IR outputs which allow the use of a wired-AND configuration. The device has all output pins directly opposite the corresponding input pins, facilitating board layouts in expanded configurations.

Features

- 64 words by 9-bit organization
- 20 MHz typical shift-in, shift-out rates
- Readily expandable in word and bit dimension
- Asynchronous or synchronous
- TTL inputs and outputs
- Three state outputs
- Master reset input to clear data and control
- Output pins directly opposite corresponding input pins
- OR, IR have resistive pull-ups to allow wired-AND Configuration
- Ceramic 28-pin dual-in-line package

TDC1022

Floating Point Arithmetic Unit
22 Bit

The TDC1022 is a high speed, TTL compatible, 22-bit VLSI floating point arithmetic unit. It operates on two binary numbers, each with a 16-bit two's complement significand and a 6-bit two's complement exponent. Its high performance results from a proven method developed and patented by TRW (U.S. Patent No. 3,900,724). The main internal adders and shifters achieve a speed power product of less than 1.0 picojoule per equivalent gate.

One output and two input data registers are provided along with three-state outputs. These registers are positive-edge triggered type D flip-flops with a common clock. An input latch is provided to demultiplex the two input operands from a single input bus.

The TDC1022 allows parallel loading and outputting of data and several external command and flag options. An internal pipeline register may be enabled to ensure a full arithmetic throughput rate of 10MHz, (100 nsec, Typ.).

Features

- Floating Point, Two's Complement
- Dynamic Range Equivalent to 64 Bits Fixed Point
- Selectable Pipelining, 100 nsec stage time
- Three-State TTL Output
- Selectable Add/Accumulate Function
- 12 Function Data/Arithmetic Control
- ÷2 Scaling Function for FFT's
- Selectable Saturating Arithmetic
- Parallel Data I/O
- Single 5V Supply
- 64 Pin DIP or 68 Contact Ceramic Leadless Chip Carrier

Applications

- Image Processing
- ALU in Array Processor
- Conversion between Fixed and Floating Point Numbers
- Digital Filters
- FFT's
- Secure Communications

Instructions

Zero	A Denormalize
A + B	− A Denormalize
A − B	Limit (LMT)
B − A	Round (RND)
B Normalize	÷2, Scale (SCA)
− B Normalize	Accumulate (ACC)

TDC1028
Advance Information

FIR Digital Filter
Building Block

The TRW TDC1028 is a video-speed, TTL compatible bit-slice "building block" for Finite Impulse Response (FIR) digital filters and for multi-bit digital correlators. It is implemented as a bit-slice processor independently in the coefficient and signal data word dimensions. Word lengths can be multiples of four bits. Two's complement or unsigned magnitude operation is independently selectable for both coefficients and signal data words.

The TDC1028 provides eight delay stages, eight multipliers, and eight adders in a single integrated circuit. Eight coefficient storage registers are also provided for ease in programming filter characteristics. One coefficient may be changed every clock cycle. The delay registers and the adder pipeline registers have been merged for efficiency.

Features

- 20 MegaSamples Per Second (MSPS) Throughput Rate
- Eight Coefficients
- Cascadable (To>36 Taps) Without External Components
- 4 Bit Coefficient And Signal Data Words
- Independently Expandable Coefficient And Signal Word Length
- Independently Selectable Format For Coefficients And Signal Data Words (Two's Complement Or Unsigned Magnitude)
- 48-Pin DIP Or 68-Contact Leaded Or Leadless Chip Carrier
- Single +5V Power Supply
- TTL Compatible

Applications

- Digital Video Filters
- Matched Filters
- Pulse Compression
- Multi-Bit Correlation
- Waveform Synthesis
- Adaptive Filters

TDC1023
Preliminary Information

Digital Output Correlator
64 Bit

The TRW TDC1023 is a 64-bit monolithic, all digital correlator with a 7-bit three-state buffered digital output. This device consists of three 64-bit independently clocked shift registers, one 64-bit reference holding latch (exclusive ORed with the A data register), and a 64-bit independently clocked digital summing network. The device is capable of a 20 MHz (typical) parallel correlation rate.

The 7-bit threshold register allows the user to pre-load a binary number from 0 to 64. Whenever the correlation score is equal to or greater than the number in the threshold register, the threshold flag goes active.

The 64-bit mask register (M register) allows the user to mask or selectively choose "no compare" bit positions, enabling total word length flexibility.

The correlation process begins when the reference word is serially shifted into the B register. Then by clocking LDR, the data is parallel loaded into the R reference latch. This allows the user to serially load a new reference word into the B register while correlation is taking place between the A register and R latch. The two words are continually compared bit-for-bit by exclusive OR circuits. Each exclusive OR provides one bit to the digital summer. The output is a 7-bit word representing the sum of positions which agree at any one time between the A register and R latch.

A control provides either true or inverted binary output formats.

Features

- 20-MHz (Typical) Correlation Rate
- Bipolar, TTL Compatible
- All Digital
- Single 5V Power Supply
- Serial Data Input, Parallel Correlation Output
- Programmable Word Length
- Independently Clocked Registers
- Power Dissipation: 900 mW (Typical)
- Available In 24-Pin DIP And 28-Contact Leadless Chip Carrier
- Output Format Flexibility
- Three State Outputs

Applications

- Check Sorting Equipment
- High-Density Recording
- Bar Code Identification
- Radar Signature Recognition
- Video Frame Synchronization
- Electro-Optical Navigation
- Pattern And Character Recognition
- Cross-Correlation Control Systems
- Error Correction Coding

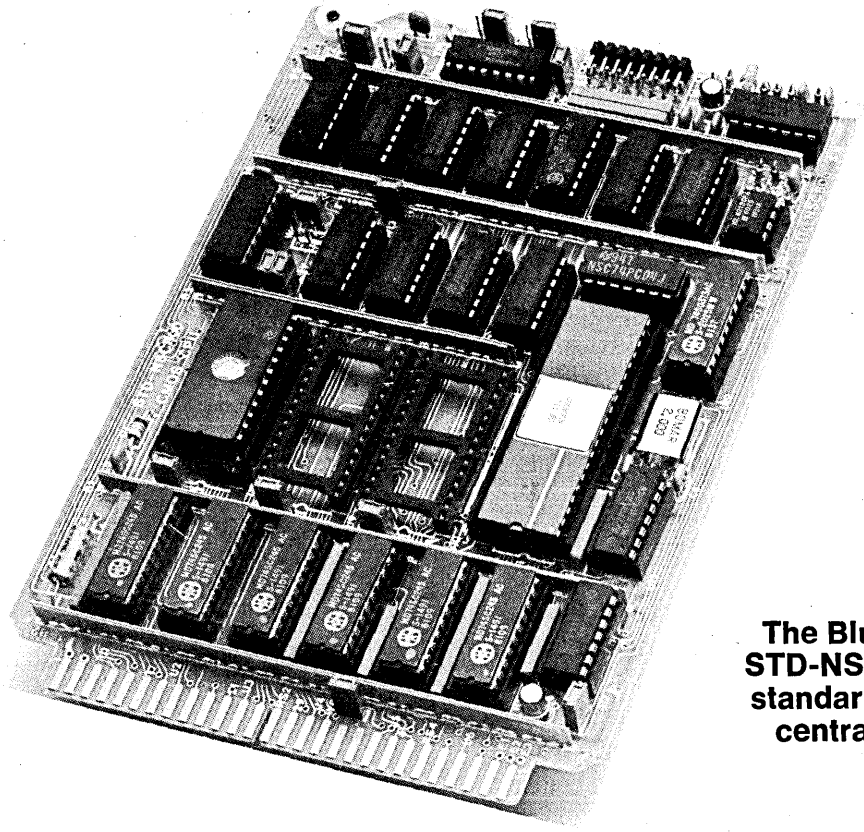
For Key Data On Every IC On This Board, The Place To Look Is...



The Blue Chip Computer STD-NSC800 is a CMOS standard bus compatible central processor card.

Equipment and system design often require the use of a wide variety of integrated circuits in order to obtain optimum performance. One way for an engineer to be certain that he hasn't overlooked the best device for his application is to refer to the pages of IC MASTER.

Surveys conducted by IC MASTER, integrated circuit manufacturers, and independent research agencies confirm that four out of five IC MASTER users have specified one or more products as the result of using IC MASTER.

Device No.	Description
NMC27C16	Erasable CMOS PROM
NSC800	8-bit Microprocessor
74SC245	3-State Octal Bus Driver
MD74SC373	Noninverted D-Type Transparent Latch
ICL8212C	Micropower Voltage Detector
MM74PC00	Quad 2-Input NAND Gate
MM74PC32	Quad 2-Input OR Gate
MM74PC08	Quad 2-Input AND Gate
MD74SC139	Octal Decoder/Demultiplexer
MM74PC74	Dual Type-D Flip-Flop
MSC74PC07	Hex Inverter
MM74C30	8-Input NAND Gate

Representative list of ICs on the Blue Chip Computer STD-NSC800 card. Key specifications for all of these ICs can be found in IC MASTER.

DELAY ELEMENTS
(delay elements for generating delay lines)

- Buffers 3 and 4 offer 3-fold increase in I_{OL} (12 mA/24 mA)
- Total power dissipation 38 mW

typical performance

DELAY ELEMENT	LOGIC	DELAY
Gates 1 and 6	Inverting	27.5 ns
Gates 2 and 5	Noninverting	46.5 ns
Buffers 3 and 4	2-Input NAND	6 ns

GATED FULL ADDERS

typical performance

TYPE	CARRY TIME	ADD TIME	POWER PER BIT
'80	10.5 ns	52 ns	105 mW

SN5480 (J,FH) SN7480 (J,N)

NOTES: 1. $A = \overline{A_C} + \overline{A^*} + A1 \cdot A2$, $B = \overline{B_C} + \overline{B^*} + B1 \cdot B2$

2. When A* is used as an input, A1 or A2 must be low. When B* is used as an input, B1 or B2 must be low.

3. When A1 and A2 or B1 and B2 are used as inputs, A* or B*, respectively, must be open or used to perform dot-AND logic.

1616

16-×-16-BIT MULTIMODE MULTIPLIERS

- Multiplies Any Combination of Unsigned, Signed, Integer, or Fractional Inputs
- Registered Inputs and Outputs
- Comparable to TRW's MPY-16HJ
- Choice of Single-Signed, Double-Signed, Unsigned, or Signed Fractionally Adjusted Output
- Overflow Detected if a Combination of Input Data and/or Output Formats Result in a Number that Cannot be Represented
- Rounding is Provided for Both Integer and Fractional Results
- Flexible Input-Output Format Aids in Expansion to Multiple Precision Results
- 55 ns Typical Unclocked Multiply Time
- Power Dissipation Approximately 1.5 W
- 3-State Outputs
- Ideal for Signal Processing, Including Digital Filters, FFTs, and Automatic Line Integration
- Output may be Complemented
- Package Options Include Both Plastic and Ceramic Chip Carriers in Addition to Plastic and Ceramic DIPs
- Dependable Texas Instruments Quality and Reliability

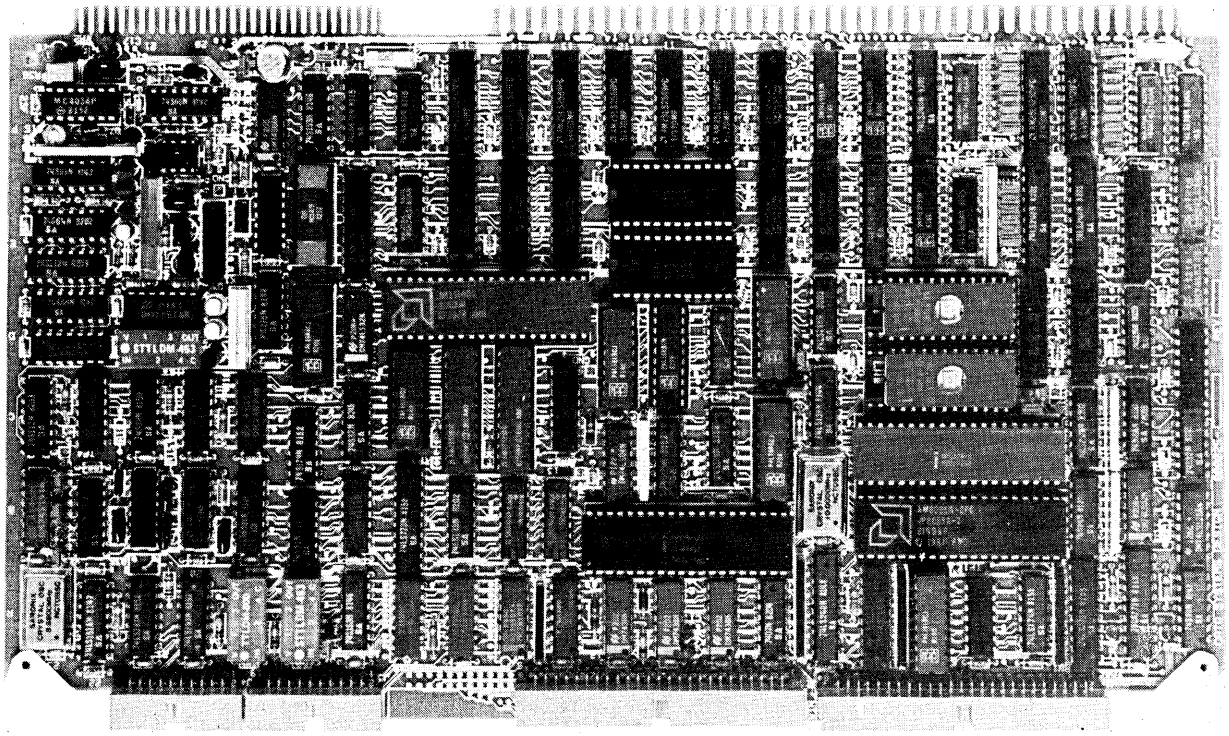
For Key Data On Every IC On This Board, The Place To Look Is...



The Data System Design 7215 is a single-board controller with pipelined architecture that can simultaneously control Winchester, streaming tape, and floppy drives.

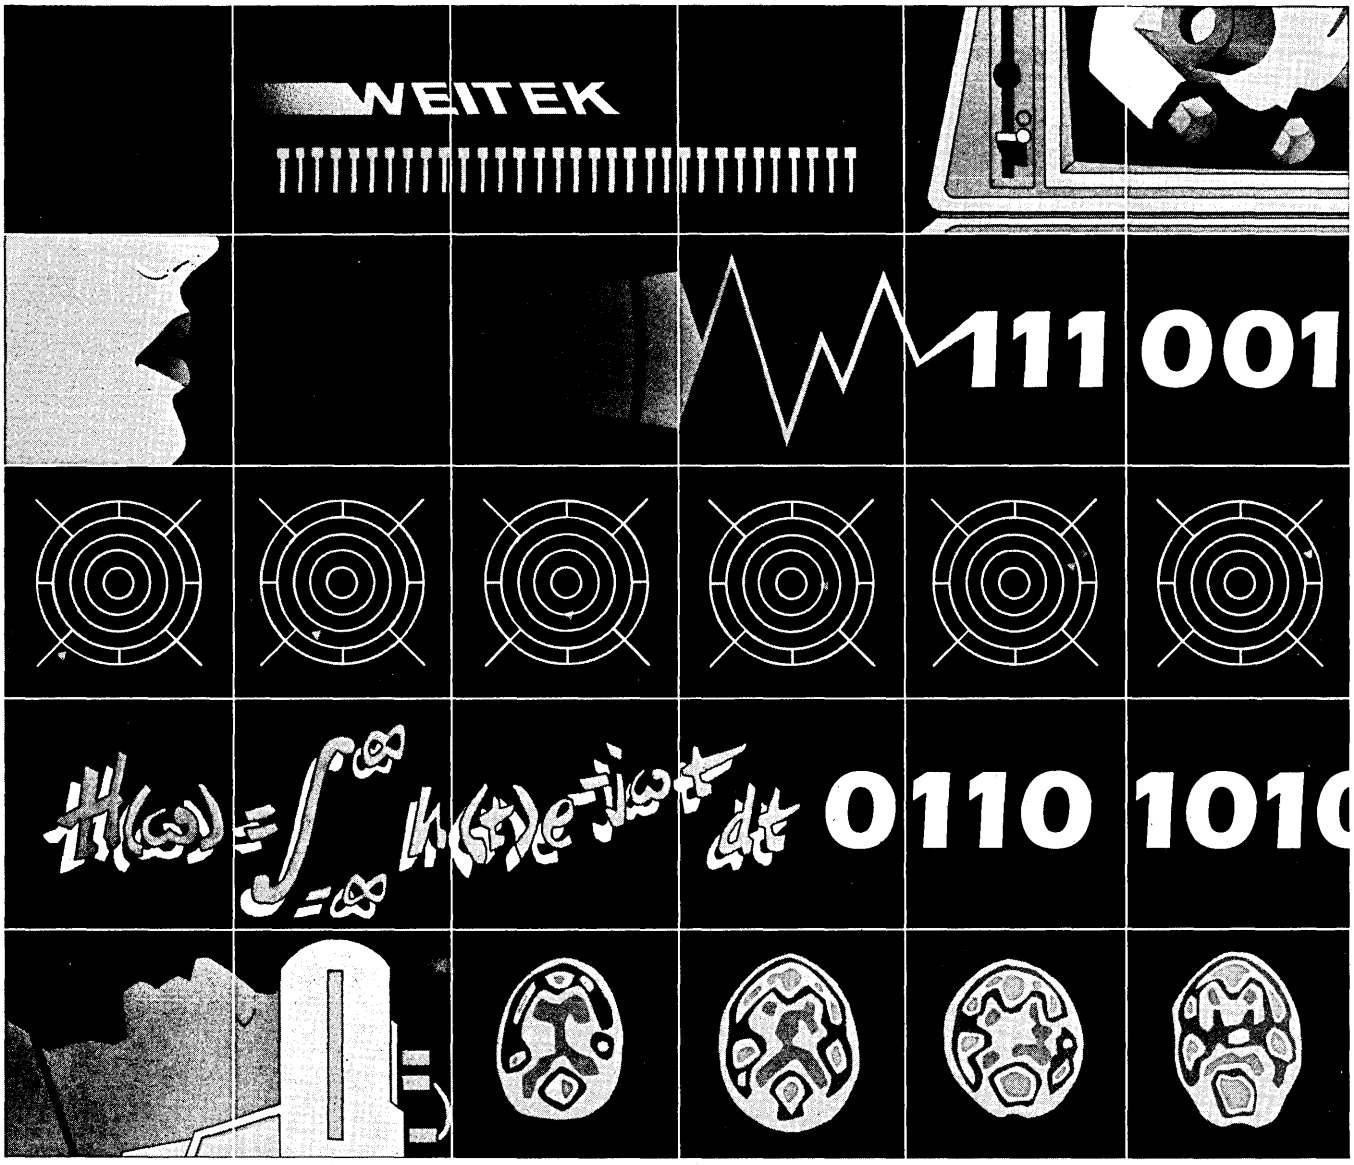
Device No.	Description
AM25LS2569	Up-Down Binary Counter with Synchronous Preset
AM2910	Dual Retriggerable Monostable Multivibrator
AM26S02	Programmable Schottky Read-Only Memory
AM27S35	12-Bit Microprogram Controller
AM8085	Complete 8-Bit Parallel Central Processing Unit
CA3130	5-to-16-Volt Single Stash Supply Op Amp
2732	4096 x 8 TTL PROM
8237	DMA Controller
DM7438	Quad 2-Input TTL NAND Buffer
DM8334	8-Bit Addressable TTL Latch
DS75107	Differential Line Receiver
F74S132	Quad 2-Input NAND Schmitt-Trigger
MC4024	Dual Voltage-Controlled TTL Multivibrator
MK4802	2048 x 8 Static NMOS RAM
PAL16L8	Field Programmable Logic Array
PAL16R6	Field Programmable Logic Array
PAL16R8	Field Programmable Logic Array
7407	Hex Buffer/Driver
74123	Dual Retriggerable Monostable Multivibrator
74368	Hex Inverter, 3-State
74LS02	Quad 2-Input TTL NOR Gate
74LS04	Hex Inverter
74LS125	Quad Gated TTL Buffer, 3-State
74LS138	3 Line to 8 Line Decoder/Demultiplexer
74LS151	8-Input Multiplexer
74LS161	Binary Counter
74LS166	8-Bit Parallel-In, Serial-Out Shift Register with Clear

Device No.	Description
74LS174	Hex D-Type Edge-Triggered Flip-Flop with Clear
74LS240	Octal Bus Driver (Schmitt Trigger)
74LS244	Octal Bus Driver (Schmitt Trigger), Non-Inverting
74LS257	Quad 2-Input Multiplexer, Non-Inverting
74LS273	Octal D-Type Edge-Triggered Flip-Flop, 3-State
74LS299	8-Bit Universal Shift Register
74LS365	Hex Buffer, 3-State
74LS373	8-Bit Latch
74LS374	Octal D-Type Edge-Triggered Flip-Flop, 3-State
74LS393	Dual 4-Bit Binary Counter
74LS533	D-Type 8-Bit Latch
74LS670	16-Bit (4x4) Register File with Simultaneous Read/Write
74S00	Quad 2-Input NAND Gate
74S03	Quad 2-Input NAND Gate, Open Collector
74S04	Hex Inverter
74S112	Dual "J-K" Negative Edge-Triggered Flip-Flop
74S151	8-Input Multiplexer
74S153	Dual 4-Input Multiplexer
74S174	Hex D-Type Edge-Triggered Flip-Flop with Clear
74S175	Quad D-Type Edge-Triggered Flip-Flop with Clear
74S240	Line Driver, Single Ended, 3-State, Inverting
74S32	Quad 2-Input OR Gate
74S51	Dual 2-Wide 2-Input AND-OR-Invert Gate
74S64	4-2-3-2-Input AND-OR-Invert Gate
74S74	Dual D-Type Positive Edge-Triggered Flip-Flop
75110	Line Driver, Differential, Twisted Pair Level Shifting

Representative list of ICs on the Data Systems Design 7215 board.
Key specifications for all of these ICs can be found in IC MASTER.

IC MASTER

BE SURE. BEGIN WITH THE IC MASTER



Wherever you use Weitek's NMOS 16 x 16's, you'll have 2.5W to spare.

Until now, you've had to accept bipolar TTL multipliers and multiplier-accumulators that consume up to 5W of valuable power. Now Weitek introduces the WTL 1010 and WTL 1016. Through advanced NMOS VLSI design, they offer the same high speed processing at just half the power.

	Data Size	Speed*	Power*
WTL 1016 Multiplier	16x16	140 ns	2.5W
WTL 1010 Multiplier – Accumulator	16x16	165 ns	3.0W

*Test Conditions: T_A = 0-75° C, V_{CC} = 5V ± 5%

Whether you're designing military signal processing systems, graphics systems, digital filters or Fast Fourier Transform processors . . . wherever you've used other 16 x 16 multipliers and multiplier – accumulators . . . the WTL 1016 and WTL 1010 are pin-for-pin functional replacements. Power supply requirements of 5V and TTL input/output levels are compatible, too.

For immediate detailed information, phone Weitek now at (408) 727-6625. We'll tell you everything about WTL 1016 and WTL 1010. –The only question you'll have to answer is what to do with the power you'll have to spare.

All Weitek 16x16's are processed to MIL STD 883.

WTL 1016

WTL1016
NMOS 16 x 16 PARALLEL MULTIPLIER

DIGITAL

Weitek

Features

- 16x16 parallel array multiplier
- High speed, 100ns typical multiply time
- Standard NMOS Technology
- Low Power, 1.5W typical
- Single 5V supply
- Standard TTL compatible I/O levels
- Output latch mode selectable for clocked or transparent operation
- Mixed mode two's complement and unsigned magnitude multiplication
- Pin-for-pin functional replacement for TRW MPY16HJ and AMD Am29516
- Processed to MIL STD 883

Description

WTL 1016 is an NMOS 16x16 parallel array multiplier characterized by high speed, high performance, and low power dissipation. A typical multiply time of 100ns, advanced NMOS processing, and a multiplication scheme based on Booth's algorithm, all provide state-of-the-art performance at a power dissipation level 50% less than that of existing bipolar TTL counterparts.

A pin-for-pin functional replacement for TRW's MPY16HJ and AMD's Am29516, WTL 1016 operates from a single 5 volt supply and is compatible with standard TTL logic levels.

The architecture of WTL 1016 (see Block Diagram) generates a 32 bit product of two 16 bit data words input to the X and Y data latches. These operands can be specified as either two's complement or unsigned magnitude for mixed or unmixed mode operation. Input lines C_x and C_y control the input data representation. Two series-configured 32 bit registers, at the output of the multiplier array, provide product format adjustment and two 16 bit latch functions for the most and least significant halves (MSP and LSP) of the product. Feed-through control line, FT, allows the flexibility of either clocked or asynchronous operation of the MSP and LSP latches. In the asynchronous mode, the product latches are transparent to data flow. The 32 bit product is output on two 16 bit three-state buses. The LSP portion of the product output and the Y input operand share common I/O pins.

The WTL 1016 finds applications in a variety of digital signal processing functions and upgrades to mini and microcomputer systems. In the area of digital signal processing, applications include digital filtering, FFT, floating point, image/video, and speech (recognition and synthesis) processing.

Coming on Strong in VLSI

WTL1516/1517
ADVANCED DATA

WTL1516/1517
NMOS 16 × 16 PARALLEL MULTIPLIERS

DIGITAL

Weitek

Features

- 16×16 parallel array multiplier
- High-speed, 90 ns typical multiply time
- Standard NMOS technology (I_{CC}=230 mA typical)
- Low power
- WTL1517 optimized for microprogramming single clock with register enables
- Standard TTL power 5V supply and input/ output levels
- Input/output latches selectable for clocked or transparent mode of operation
- Mixed mode two's complement and unsigned magnitude multiplication
- WTL1516 pin-for-pin functional replacement for TRW MPY16HJ, AMD 29516/29517 and WTL1016
- WTL1517 pin-for-pin functional replacement for AMD 29517

Description

The WTL1516/1517 are 16×16 parallel array, high-speed multipliers (Tm=90 ns typical) fabricated using NMOS silicon gate technology. By use of a modified Booths algorithm and advanced NMOS VLSI design processes, these multipliers provide a performance comparable to existing bipolar TTL multipliers at less than half the power consumption (I_{CC}=230 mA typical). The WTL1516/1517 also use standard TTL power supplies of 5V. The multipliers have input and output latches which can be operated in a clocked mode or transparent mode.

Applications of the multipliers include a variety of digital signal processing systems including floating point processors, FFT processors, image/ video processors, speech recognition and synthesis, digital filtering, etc. Input data are accepted in the form of 16-bit two's complement and unsigned magnitude in mixed or unmixed mode.

In the WTL1516 the X, Y, MSP and LSP registers have independent clocks (CK_X, CK_Y, CK_M, CK_L). The output multiplexer control (MSPSEL) uses a pin which is a supply ground in the TRW MPY16HJ and WTL1016. When this control is LOW the function is that of the MPY16HJ and WTL1016, thus allowing full compatibility.

The WTL1517 differs in that it has a single clock input (CK) and three register enables (ENX, ENY, ENP) for the two input registers and the entire product. This allows use of the WTL1517 in microprogrammed systems. In both devices data are entered into the registers on the positive edge of the clock.

WTL2516/2517
NMOS 16 × 16 PARALLEL MULTIPLIERS

Features

- 16×16 parallel array multiplier
- 200 ns typical multiply time
- NMOS technology
- Low power, 0.6W typical
- Low cost plastic package
- WTL2517 optimized for microprogramming single clock with register enables
- Standard TTL power 5V supply and input/output levels
- Input/output latches selectable for clocked or transparent mode of operation
- Mixed mode two's complement and unsigned magnitude multiplication
- WTL2516 pin-for-pin functional replacement for TRW MPY16HJ, AMD 29516/29517 and WTL1016
- WTL2517 pin-for-pin functional replacement for AMD 29517

Description

The WTL2516/2517 are 16×16 parallel array, high-speed multipliers (Tm = 200 ns typical) fabricated using NMOS silicon gate technology. By use of a modified Booths algorithm and advanced NMOS VLSI design processes, these multipliers provide a performance comparable to existing bipolar TTL multipliers at less than 1/4 the power consumption (I_{CC} = 120 mA typical). The WTL2516/2517 also use standard TTL power supplies of 5V. The multipliers have input and output latches which can be operated in a clocked mode or transparent mode.

The multipliers are particularly useful in low to moderate performance, low cost, digital computationally intensive applications. These include low cost, relatively low resolution graphics functions involving 3D image rotation such as video games, small business/desk-top computers and low cost graphics displays. Other functions include voice frequency, digital filtering and processing for modems, speech synthesis, speech recognition and consumer audio. Input data are accepted in the form of 16-bit two's complement and unsigned magnitude in mixed or unmixed mode.

In the WTL2516 the X, Y, MSP and LSP registers have independent clocks (CK_X, CK_Y, CK_M, CK_L). The output multiplexer control (MSPSEL) uses a pin which is a supply ground in the TRW MPY16HJ and WTL1016. When this control is LOW the function is that of the MPY16HJ and WTL1016, thus allowing full compatibility.

The WTL2517 differs in that it has a single clock input (CK) and three register enables (ENX, ENY, ENP) for the two input registers and the entire product. This allows use of the WTL2517 in microprogrammed systems. In both devices data are entered into the registers on the positive edge of the clock.

WTL1024
ADVANCED DATA

WTL1024
NMOS 24 × 24 PARALLEL MULTIPLIER

DIGITAL

Weitek

Features

- 24×24 bit parallel multiplication with double precision output.
- Pipelined architecture, with separate 24-bit wide inputs and outputs.
- High-speed, Tm=220 ns typical.
- Low power NMOS fabrication, I_{CC}=300 mA typical.
- TTL compatible input/output.
- Two's complement, unsigned magnitude selectable modes with mixed mode operation.
- Product left shift up to three bits.
- Product round with overflow flag.
- Useful in 16-bit computer systems for extended integer arithmetic operations.
- Provides floating point 24-bit mantissa multiply with external standard TTL for exponent adjust.

Description

The WTL1024 is a 24×24 operand input, 48-bit product output parallel multiplier, fabricated using advanced NMOS VLSI design processes to provide high speed (Tm=220 ns typical) at low power (I_{CC}=300 mA typical). Pipelined architecture is used for ease of use in microcomputer based systems with operands and products loaded and unloaded 24 bits at a time. Inputs and outputs are latched with inputs having a separate chip select and outputs having three state capability. Separate operand data format controls are provided by TCX and TCY for classification of operands as two's complement or sign magnitude data. F1 and F2 are output flag signals derived from the most significant bits of the product register. The product can be shifted left from 0 to 3 bit positions by means of a pair of shift control inputs, SHA and SHB. The output flag signals, F1 and F2, and shift control inputs, SHA and SHB, can be used in conjunction with a standard TTL ALU to provide exponent data normalization for floating point operations.

Rounding of the product to 24 bits is under control of the RND control input and is performed after shifting. Flag F3 indicates when overflow occurs in the round operation. The two halves of the 48-bit product (MSP and LSP) are selected for output by the SELP output multiplexer control. Output enable signal $\overline{OE}$ controls three state. The WTL1024 is useful in integer operations such as in 16-bit computer/microcomputer data environment where recursive computations often require the ability to handle extended product operations. For floating point data multiplication operations, the WTL1024 can provide mantissa multiplication in conjunction with external readily available LSI circuits such as the 74S381 ALU and 2901 bit slice, etc., for exponent adjust.

Coming on Strong in VLSI

WTL 1010

Features

- 16x16 parallel multiplication and product accumulation
- High speed, 115ns typical multiply-accumulate time
- NMOS silicon gate technology
- Low power, 1.9W typical
- Single 5V supply
- Standard TTL compatible I/O levels
- Performs subtraction and double precision addition and multiplication
- Round control
- Pin-for-pin functional replacement for TRW 1010J
- Processed to MIL STD 883

Description

The WTL 1010 is a 16x16 parallel multiplier-accumulator (MAC). Fabricated using NMOS silicon gate technology, the WTL 1010 offers a low power alternative to existing bipolar TTL counterparts (power dissipation <50%) with no loss in performance. The high performance is achieved through high speed operation (115ns typical multiply-accumulate time), use of the efficient Booth's algorithm, and advanced VLSI technology.

A pin-for-pin functional replacement for TRW's TDC 1010J, the WTL 1010 operates from a single 5 volt supply and is compatible with standard TTL logic levels.

The WTL 1010, under control of the ACC input (see Block Diagram), performs either the multiply only or multiply-accumulate function. In either mode, input data, X_1 and Y_1 can be specified as two's complement or unsigned magnitude. Input data representation is selectable via input control line TC. In the multiply only mode, extended product (XTP) data is sign extended or set to zero for two's complement and unsigned magnitude arithmetic, respectively. Additionally, a RND control is available for rounding up the most significant product (MSP) and extended product (XTP) data. In the multiply-accumulate mode the double precision accumulated answer is rounded back to single precision or single precision plus XTP bits.

Device architecture provides input and output data registers; three state output data buses with independent, non-registered control; initial data pre-loading capability; and requires time sharing of the common least significant product (LSP) and input data (Y_1) I/O lines. Input lines TSX, TSM and TSL respectively control the outputs of the XTP, MSP and LSP registers.

In the multiply-accumulate mode (ACC active) output data can be added to or subtracted from the next product. When SUB is also active, subtraction is performed. Otherwise addition is performed. When control line PREL is active, all output lines are forced to the high impedance state and external data can be loaded into the output registers. In this mode, TSX, TSM, and TSL change function and control loading of data into the output registers (see Preload Truth Table).

The WTL 1010 can be efficiently applied in a variety of digital signal processing functions including digital filtering (recursive, non-recursive, wave) and FFT processing (complex multiplication, butterfly computation). Additionally the WTL 1010 can effectively be employed in upgrading the computational capability of mini and microcomputer systems.

INTRODUCTION TO MICROPROCESSORS

This section begins with a "Master Selection Guide" that covers all major parameters needed to choose a microprocessor for particular application.
Next, once you've chosen the proper microprocessor for your application, go to the "System Components" section. Arranged alphanumerically by microprocessor, it shows all the available peripheral devices that work with a particular microprocessor.
Finally, there is a "General Purpose" section describing devices that can be used in different microprocessor systems, not necessarily with one family.
All manufacturers are covered in alphanumeric sequence.

Detailed Product Information provided by:

Advanced Micro Devices	1201
American Microsystems, Inc.	1247
Fairchild	1253
Fujitsu Microelectronics	1305
General Instrument	1309
Harris Semiconductor	1333
Hitachi	1345
Intel	1347
Motorola Semiconductor	1361
RCA	1457
Seeq, Inc.	1492
Signetics	1501
Synertek	1526
Texas Instruments	1552
Western Digital	1566
Zilog	1605

The manufacturers listed above have provided detailed information on their latest and most significant products.

EINFÜHRUNG MIKRO-PROZESSOREN

Dieser Abschnitt beginnt mit einem "Master Selection Guide", der alle Parameter enthält, die zur Auswahl eines für einen bestimmten Anwendungsfall geeigneten Mikroprozessors erforderlich sind.

Haben Sie einmal den für Ihren Anwendungsfall geeigneten Mikroprozessor gefunden, so gehen Sie weiter zum Abscnitt "Systemkomponenten" (System Components). In alphanumerischer Reihenfolge der Mikroprozessoren, enthält dieser Teil alle peripheren Bausteine, die für einen bestimmten Mokroprozessor verfügbar sind.

Schlieβlich gibt es noch den Abschnitt "Allgemeine Verwendung" (General Purpose) mit einer Beschreibung von Bauelementen, die für verschiedene Mikroprozessoren geeignet und nicht ausschlieβlich an ein System gebunded sind.

Alle Hersteller sind in alphanumerischer Reihenfolge aufgeführt.

© IC MASTER 1983

INTRODUCTION AUX MICRO-PROCESSEURS

Cette Section débute par un Guide Général de Sélection qui couvre tous les paramètres importants utilisés dans le choix d'un microprocesseur pour une application bien déterminée.

Après avoir choisi le microprocesseur nécessaire à votre application, reportez-vous à la Section "Composants du Système (System Components). Une liste alphanumérique des microprocesseurs indique quels types d'appareils sont à utiliser avec tel ou tel microprocesseur.

Enfin, une Section intitulée "Applications Générales" ((General Purpose) décrit les appareils qui peuvant être utilisée dans différents systèmes de microprocesseur, et n'appartenent pas uniquement à une sule famille.

Toutes les sociétés fabricantes sont étudiées par ordre alphanumérique.

© IC MASTER 1983

INTRODUCCIÓN AL MICROPROCESOR

Esta sección empieza con una Guía Maestra de Selección que cubre los parámetros necesitados en la selección del microprocesor para una aplicación determinada.

Después, una vez escogido el microprocesor para su aplicación, refiérase a la sección "Componentes de Sistema." Arreglado en orden alfabético y numérico por microprocesor, muestra todas las componentes periferales que funcionan con un microprocesor determinado.

Finalmente, hay una sección de "Propósito General" describiendo las componentes que pueden ser usadas en distintos sistemas de microprocesores, no necesariamente dentro de una familia.

Todos los fabricantes aparencen en orden alfabético y numérico.

x		x	x	x		On chip counter.	HMCS45	Hitachi	
x		x	x	x			HMCS45C	Hitachi	
x						Enlarged ROM version of HMC543C, 32 I/O lines.	HMCS46C	Hitachi	
x						Enhanced I/O version of HMC54C, 44 I/O lines.	HMCS47C	Hitachi	
		x		x		Display processor on chip which formats, decodes, and displays. Up to 128 duplex LCD drivers capability with 58 on chip in present configuration. 4 programmable inputs.	M1001	Monosil	
		x		x		On chip display processor controls 8 digit LED multiplexed display. 2-4 bit I/O ports, 1-4 bit input port, 1-4 bit output port.	M1111	Monosil	20
x		x	x	x		48 version, MC141099, permits use of external PROM, RAM or ROM for program development.	MC141000	Motorola	
x		x	x	x		48 D/N version, MC141099, permits use of external PROM, RAM or ROM for program development.	MC141200	Motorola	
x		x	x	x		Same as COP2440 except no on chip ROM and faster execution time (4μs). Interfaces with MM2716 EPROM. COP2304 is extended temperature range device.	COP2404	National	
x					Eurotechnique	Dual CPU microcontroller, programmable counter, zero crossing detector serial I/O port. 35 I/O lines, COP23XX extended temperature range.	COP2440	National	
x		x	x	x		Piggyback Microcontroller. Same as COP2440 except socket for development EPROM.	COP2440R	National	
x					Eurotechnique	Same as COP2440 except 23 I/O lines.	COP2441	National	
x		x	x	x		Piggyback Microcontroller. Same as COP2441 except socket for development EPROM.	COP2441R	National	
x					Eurotechnique	Same as COP2440 except 19 I/O lines.	COP2442	National	
x		x	x	x	Western Digital	Has piggyback EPROM socket. Will accept: MM2716, NM27C16, MM2758A, MM2758B. 1K byte accessable.	COP402	National	
x		x	x	x	Western Digital	Has piggyback EPROM socket. Will accept: MM2716, NM27C16, MM2758A, MM2758B. 1K byte accessable.	COP402M	National	30
x		x	x	x	Western Digital	Has piggyback EPROM socket. Will accept MM2716, 2758A, 2758B or NM27C16 EPROM. 2K Byte accessable. Open drain memory interface drivers.	COP404LP	National	
x		x	x	x	Western Digital	Same as COP404LP except push pull memory interface drivers.	COP404LS	National	
x		x	x	x		4μs instruction cycle time, 20 I/O lines, 2 level subroutine stack, COP310C operates extended temperature range, COP210C operates full temperature range.	COP410C	**National (1361)**	
x		x	x	x	Eurotechnique, Western Digital	16 I/O lines, 24 pins, COP310L has extended temperature range (-40°C to -85°C).	COP410L	**National (1361)**	
x		x	x	x		4μs instruction cycle time, 16 I/O lines, 2 level subroutine stack, COP311C operates extended temperature range, COP211C operates full temperature range.	COP411C	**National (1361)**

x		x	x	x	Eurotechnique, Western Digital	13 I/O lines, 20 pins, COP311L has extended temperature range (-40°C to -85°C).	COP411L	**National (1361)**	
x		x	x	x	Eurotechnique, Western Digital	COP32X is extended temperature range version. Also available in smaller packages: COP421 series-24 pins, COP422 series-20 pins.	COP420	National	
x		x	x	x	Eurotechnique, Western Digital	CMOS version of COP420.	COP420C	National	
x		x	x	x	Eurotechnique, Western Digital	Same as COP420 except 23 I/O lines.	COP420L	National	
x		x	x	x		Basically the same as COP420 except piggyback microcontroller. CPU, RAM, I/O and EPROM socket. Accepts: MM2716, NMC27C16, MM2758A, MM2758B. 1K byte accessable.	COP420R	National	
x		x	x	x	Eurotechnique	CPU version of COP2440 series, COP340 is extended temperature range version. 40 pins. 35 I/O lines.	COP440	National	
x		x	x	x		Piggyback Microcontroller: CPU, RAM, I/O and EPROM socket. Accepts: MM2716, NMC27C16, MM2758A, MM27588 EPROMs. Same electrical specs as base P/N.	COP440R	National	
x		x	x	x	Eurotechnique	CPU version of COP2440 series, COP341 is extended temperature range version. 28 pins. 23 I/O lines.	COP441	National	
x		x	x	x		Piggyback Microcontroller: CPU, RAM, I/O and EPROM socket. Accepts: MM2716, NMC27C16, MM2758A, MM27588 EPROMs. Same electrical specs as base P/N.	COP441R	National	
x		x	x	x	Eurotechnique	CPU version of COP2440 series, COP342 is extended temperature range version. 24 pins. 19 I/O lines.	COP442	National	10
x		x	x	x	Eurotechnique, Western Digital	28 pins, 16 I/O lines.	COP444L	National	
x		x	x	x		Piggyback Microcontroller: CPU, RAM, I/O and EPROM socket. Accepts: MM2716, NMC27C16, MM2758A, MM27588 EPROMs. Same electrical specs as base P/N.	COP444LR	National	
x		x	x	x	Eurotechnique, Western Digital	24 pin package, no interrupt, 12 I/O lines.	COP445L	National	
x		x	x	x		1 chip calculator based system, expandable I/O.	MM57140	National	
x		x	x	x		2 chip calculator based system, expandable RAM, ROM, I/O.	MM5781	National	
x		x	x	x		2 chip calculator based system, expandable RAM, ROM, I/O.	MM5782	National	
x		x	x	x		1 chip calculator based system, expandable RAM, I/O.	MM5799	National	
x						μCOM-4 single chip microprocessor family. Consists of 14 individual devices with various RAM, ROM, I/O subroutine stack level options.	uCOM-4	NEC-Micro	
x						Directly drives 8 digit, 8 segment LED display, 24 I/O lines.	uPD7520	NEC-Micro	
x		x	x	x		30 I/O lines, 8-Bit programmable timer.	MSM5840RS	**OKI (3873)**	20
x		x	x	x		13 I/O lines, 40 LCD segment outputs, 12-Bit timer.	MSM58421GSK	**OKI (3873)**	
x		x	x	x		9 I/O lines, 24 Vacuum Fluorescent segment outputs, 8-Bit timer.	MSM58422RS	**OKI (3873)**	
x		x	x	x		21 I/O lines, 8-Bit timer.	MSM5842RS	**OKI (3873)**	
x		x	x	x		30 I/O lines, 8-Bit timer/counter.	MSM5845RS	**OKI (3873)**	
x		x	x	x			MN1400	Panasonic

						ROMless system evaluator supports TMS2132 PMOS family members.	SE2130P	TI	(1560)	
						ROMless system evaluator supports TMS1100/1170/1300/1370 PMOS family members.	SE2200P	TI	(1560)	
						ROMless system evaluator supports TMS2400/2470/2600/2670 PMOS family members.	SE2400P	TI	(1560)	
x		x	x	x		64 pin version, TMS-1099/SE-1, permits use of external PROM, RAM or ROM for program development. -9 volt VDD version available.	TMS1000	TI	(1557)	
x		x	x	x		3 level subroutine nesting 32 term output PLA. TMS1099/C/SE-3 for program development.	TMS1000C	TI	(1557)	
x		x	x	x		Expanded RAM version of TMS1000C.	TMS1004C	TI	(1558)	
x		x	x	x		3.5 V output drive capability. -9 volt VDD version available.	TMS1070	TI	(1557)	
x		x	x	x		Vacuum fluorescent drive (-35V) capability on output, 22 I/O lines.	TMS1070C	TI	(1557)	
x		x	x	x		A 64-pin version, TMS1098/SE-2 permits use of external PROM/RAM/ROM for program development. -9 volt VDD version available.	TMS1100	TI	(1557)	
x		x	x	x		CMOS version of TMS1100. 22 I/O lines.	TMS1100C	TI	(1557)	10
x		x	x	x		Fluorescent drive capability otherwise same as TMS1100. -9V VDD version available.	TMS1170	TI	(1557)	
x		x	x	x		64 pin version, TMS-1099/SE-1, permits use of external PROM, RAM or ROM for program development. -9 volt VDD version available.	TMS1200	TI	(1557)	
x		x	x	x		3 level subroutine nesting 32 term output PLA. TMS1099/C/SE-3 for program development.	TMS1200C	TI	(1557)	
x		x	x	x		3.5 V output drive capability. -9 volt VDD version available.	TMS1270	TI	(1557)	
x		x	x	x		Expanded I/O version of TMS1070C.	TMS1270C	TI	(1557)	
x		x	x	x		A 64-pin version, TMS1098/SE-2 permits use of external PROM/RAM/ROM for program development. -9 volt VDD version available.	TMS1300	TI	(1557)	
x		x	x	x		CMOS version of TMS1300. 28 I/O lines.	TMS1300C	TI	(1557)	
x		x	x	x		27 I/O lines, fluorescent drive capability. -9V VDD version available.	TMS1370	TI	(1557)	
x		x	x	x		Expanded memory version of TMS1000. -9V VDD version available.	TMS1400	TI	(1557)	
x		x	x	x		Vacuum fluorescent drive version of TMS1400. -9V VDD version available.	TMS1470	TI	(1557)	20
x		x	x	x		32 I/O lines. -9V VDD version available.	TMS1600	TI	(1557)	
x		x	x	x		Vacuum fluorescent drive version of TMS1600. -9V VDD version available.	TMS1670	TI	(1557)	
x		x	x	x		21 I/O lines, increased ROM version of TMS1000. -9V VDD version available.	TMS1700	TI	(1557)	
x		x	x	x		Interval timer, 8 bit A/D, Zerg crossing detector, handles up to -15V on outputs.	TMS2100	TI	(1558)	
x		x	x	x		Complex sound generator, LED segment outputs, handles up to -9V on outputs.	TMS2132	TI	(1558)	
x		x	x	x		Same as TMS2100 except handles up to -35V on output and has one less I/O line.	TMS2170	TI	(1558)	
x		x	x	x		LCD output driver 4-6 display digits, 32-40 segments. Handles up to -3V on outputs.	TMS2220	TI	(1558)	
x		x	x	x		LCD output driver 7.5-10 display digits, 60-80 segments. Handles up to -3V on outputs.	TMS2240	TI		
x		x	x	x		Event counter, two A/D input channels. Handles up to -15V on outputs.	TMS2300	TI	(1558)	
x		x	x	x		Same as TMS2300 except handles up to -35V on outputs.	TMS2370	TI	(1558)	30
x		x	x	x		Handles up to -15V on outputs.	TMS2400	TI	(1558)	
x		x	x	x		Handles up to -35V on outputs one less I/O line than TMS2400.	TMS2470	TI	(1558)	
x		x	x	x		Handles up to -15V on outputs.	TMS2600	TI	(1558)

					GTE Micro, CSG	External clock, IRQ, bus compatible with MC6800.	SY6514	Synertek	
					GTE Micro, CSG	External clock, IRQ, RYD, bus compatible with MC6800.	SY6515	Synertek	
	x	x	x	x		4 external interrupts, on-chip UART, 2 counter/timers, 32 I/O lines. 64-pin prototype version also Zbus compatible.	Z8	Synertek	
					SGS, Sharp, Zilog	On-chip UART, 2 counter/timers, 32 I/O lines.	Z8601	**Synertek (1540)**	
					SGS, Sharp, Zilog	On-chip UART, 2 counter/timers, 32 I/O lines, faster version of Z8601.	Z8601A	**Synertek (1540)**	
					GTE Micro	Development device simular to Z8601 but has memory control and interface lines for 4K bytes of memory.	Z8602	**Synertek (1541)**	
					GTE Micro	Same as Z8601 but faster CPU speed.	Z8602A	**Synertek (1541)**	
					SGS, Sharp, Zilog, GTE Micro	Phototyping Z8601 with socket for external 2716 EPROM.	Z8603	**Synertek (1542)**	
					SGS, Sharp, Zilog, GTE Micro	Same as Z8603 but faster CPU speed.	Z8603A	**Synertek (1542)**	
					SGS, Sharp, Zilog, GTE Micro	On chip UART, 2 programmable counter/timers, 32 I/O lines. Simular to Z8601.	Z8611	**Synertek (1543)**	10
					SGS, Sharp, Zilog, GTE Micro	Same as Z8611 but faster CPU speed.	Z8611A	**Synertek (1543)**	
					SGS, Sharp, Zilog, GTE Micro	Development device simular to Z8611 but has memory counter and interface lines for 4K bytes of memory.	Z8612	**Synertek (1544)**	
					SGS, Sharp, Zilog, GTE Micro	Same as Z8612 but has faster CPU speed.	Z8612A	**Synertek (1544)**	
					SGS, Sharp, Zilog, GTE Micro	Prototyping Z8611 with socket for external 2716 EPROM.	Z8613	**Synertek (1545)**	
					SGS, Sharp, Zilog, GTE Micro	Same as Z8613 but faster CPU speed.	Z8613A	**Synertek (1545)**	
					Zilog	ROMless version of Z8601.	Z8681	**Synertek (1546)**	
						CMOS version of Z8601.	Z86C01	**Synertek (1548)**	
						Subset of Z8 instruction set. Programmable 8 bit counter/timer.	Z8S	Synertek	
	x					8 bit timer/event counter, optional memory expansion modules available to complement on chip ROM.	TMS7000	TI (1556)	
	x					8 bit timer/event counter, optional memory expansion modules available to complement on chip ROM.	TMS7020	TI (1556)	20
	x					8 bit timer/event counter, optional memory expansion modules available to complement on chip ROM.	TMS7040	TI (1556)	
	x					On chip UART serial port, 2 8-bit timer/counters, optional memory expansion modules available to complement on chip ROM.	TMS7041	TI (1556)	
	x					8 bit timer/event counter, 4K EPROM, optional memory expansion modules available to complement on chip EPROM.	TMS70E40	TI (1556)	
	x					Low power: 35 MW, power down feature, 8-bit interval timer/event counter, optional memory expansion module available to complement on-chip ROM.	TMS70L22	TI	
		x	x	x	AMD, Intel, NEC-Micro, Fujitsu, Signetics		TMP8035	Toshiba	
		x	x	x	NEC-Micro, Fujitsu, Signetics		TMP8039	Toshiba	
		x	x	x	AMD, Intel, NEC-Micro, Fujitsu, Signetics	8748 has U.V. PROM.	TMP8048	Toshiba	
		x	x	x	NEC-Micro, Fujitsu, Signetics		TMP8049	Toshiba	
x	x	x	x	x	AMD, Mitsubishi, NEC-Micro	8080A compatible with multiplexed bus operation.	TMP8085A	Toshiba	
x	x	x	x	x	AMD, Mitsubishi, NEC-Micro		TMP8085A-2	Toshiba	30
x		x	x	x	NEC-Micro, National, OKI		TMP80C39	Toshiba	
x		x	x	x	NEC-Micro, National, OKI		TMP80C49	Toshiba	
x			x			Can cross assemble and simulate with DEC PDP-11.	CP1600	Western	
x	x	x	x	x	Mostek, NEC-Micro, SGS, Sharp	8080A software compatible.	Z80	**Zilog (1581)**	
x	x	x	x	x	Mostek, NEC-Micro, SGS, Sharp	8080A software compatible.	Z80A	**Zilog (1581)**	
x	x	x	x	x	Mostek, NEC-Micro, SGS, Sharp	8080A software compatible.	Z80B	**Zilog (1581)**	
x	x	x	x	x	Mostek, NEC-Micro, SGS, Sharp	High speed version of Z80.	Z80H	**Zilog (1581)**	
x	x	x	x	x	Mostek, NEC-Micro, SGS, Sharp	Low power version of Z80, slower speeds available.	Z80L	**Zilog (1581)**	
						The first of a series of processors. The devices are binary code compatible with the Z80 CPU. 8 and 16 bit multiple and divide.	Z8108	**Zilog (1584)**

MICROPROCESSOR–System Components

This section presents the major microprocessor system devices organized into system groups, ie F8, 6800, 8080, etc. It includes those RAM's, ROM's and PROM's which are unique to a system. It omits most general purpose memories as they are listed in the Memory section. Similarly, buffers, line drivers, transceivers, UART's, etc. are covered briefly here as they are presented in depth in the Digital and Interface sections.

Bit Slice

Macrologic Bipolar

Function	Device	Source		Line
Arithmetic Logic Register-Stack	9405AC	Fairchild		
	9405AM	† Fairchild

Advanced Micro Devices

BIPOLAR MICROPROCESSOR PRODUCTS

The Am2900 Bipolar Microprocessor Family offers a full line of LSI and support products optimized for high performance CPU and controller applications.

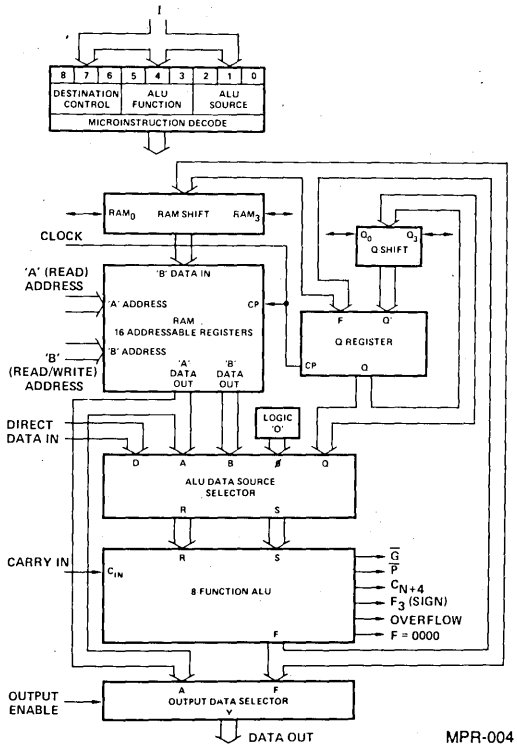
The devices use Schottky and low-power Schottky process technologies to implement LSI functions of up to 750 gates per chip. Newer techniques are in development to achieve complexities of up to 3000 gates.

The LSI members of the Am2900 family represent new kinds of building blocks for designers of high performance systems. They may be considered as a third generation of TTL functions (the first generation being SSI and the second MSI). At this level of complexity each part is specialized for a particular section of the system, such as the arithmetic unit or memory control. Many lower complexity support devices have been added to the family. Each one has been carefully selected to provide optimum interface between the LSI blocks, minimizing package count and delay.

Since the introduction of the Am2901 in 1975, new circuit design and process techniques have been applied to improve the speed and reduce the power requirements of successive generations of elements. These improved designs are designated by alpha suffixes to the device type number.

Am2901B 4-Bit Bipolar Microprocessor Slice

- 2-Address Architecture
  Independent simultaneous access to two working registers saves machine cycles
- 8-Function ALU
  Performs addition, two subtraction operations and five logic functions on two source operands
- Flexible Data Source Selection
  ALU data selected from five source ports
  203 source operand pairs for every ALU function
- Left/Right Shift Independent of ALU
  Add and shift operations take only one cycle
- Four Status Flags
  Carry, overflow, zero and negative
- Expandable
  Connect any number of Am2901s together for longer word lengths
- Microprogrammable
  Three groups of three bits each for source operand, ALU function and destination control
- Fast
  115ns for 16-bit addition
  Am2901C targeted to be 25% faster
- 40-Pin DIP

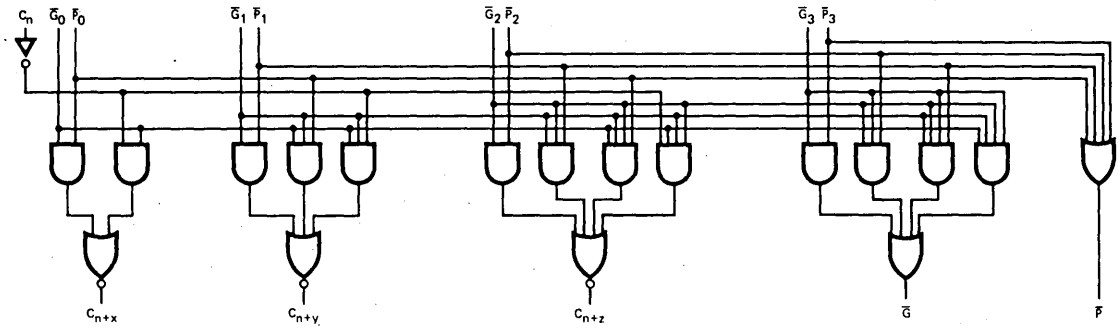


MPR-004

© IC MASTER 1983

Am2902A High-Speed Lookahead Carry Generator

- Provides Lookahead Carries across a Group of Four Am2901B or Am2903 Microprocessor ALUs
- Capable of Multilevel Lookahead for High-Speed Arithmetic Operation over Large Word Lengths
- Carry Propagation Delay – 4.5ns (Typ)
- C_{IN} to C_{OUT} – 7.0ns (Typ)
- 16-Pin DIP



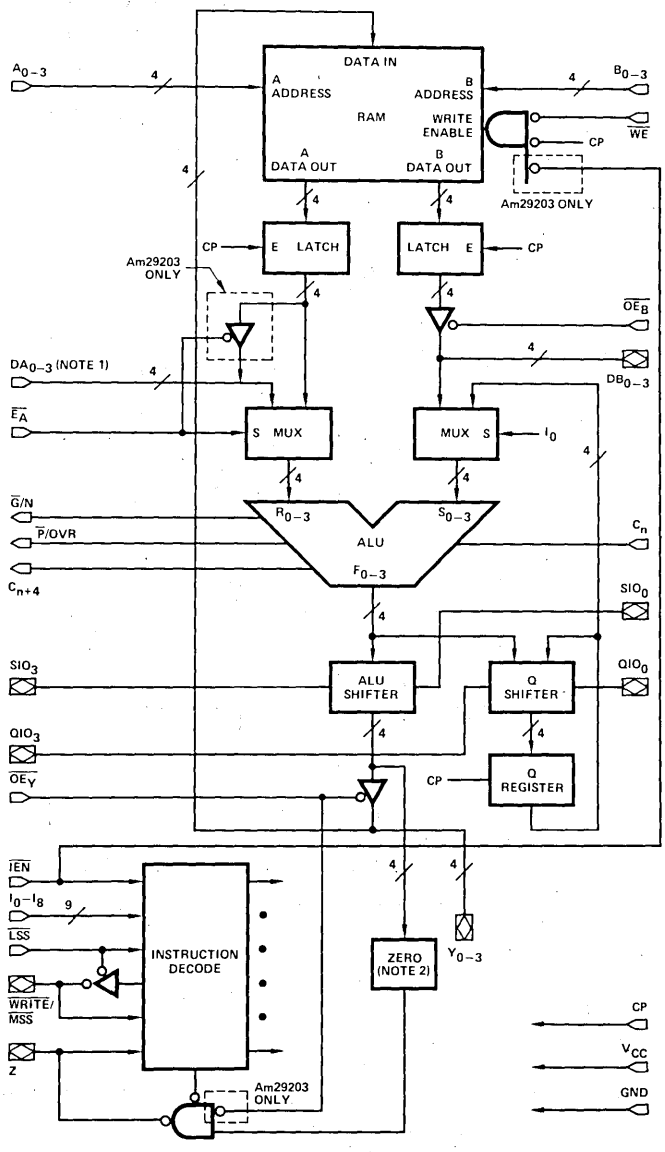
MPR-026

Am2903/Am29203 Superslice®

- Expandable Register File
  Like the Am2901B, the Am2903/Am29203 contains 16 internal working registers arranged in a 2-address architecture. But the Am2903/Am29203 includes the necessary "hooks" to expand the register file externally to any number of registers.
- Built-in Normalization Logic
  Performing multiplication with the Am2901B requires a few external gates; these gates are contained on-chip in the Am2903/Am29203. Three special instructions are used for unsigned multiplication, twos complement multiplication and the last cycle of a twos complement multiplication.
- Built-in Division Logic
  The Am2903/Am29203 contains all logic and interconnects for execution of a non-restoring, multiple-length division with correction of the quotient.
- Built-in Normalization Logic
  The Am2903/Am29203 can simultaneously shift the Q Register and count in a working register. Thus, the mantissa and exponent of a floating-point number can be developed using a single microcycle per shift. Status flags indicate when the operation is complete.
- Built-in Parity Generation Circuitry
  The Am2903/Am29203 can supply parity across the entire ALU output for use in error detection.
- Built-in Sign Extension Circuitry
  To facilitate operation on different length twos complement numbers, the Am2903/Am29203 provides the capability to extend the sign at any slice boundary.
- BCD Arithmetic (Am29203 only)
  Automatic BCD add and subtract and conversion between binary and BCD.
- Improved Byte Handling (Am29203 only)
  Zero detection and register writing can be performed on a single byte rather than the whole word.
- Two Bidirectional Data Lines (Am29203 only)
- Fast
  174ns for 16-bit addition; Am2903A is targeted to be 30% faster.
- 48-Pin DIP

© IC MASTER 1983

Am2903/Am29203 Superslice® (Cont.)



Notes: 1. DA_{0-3} is input only on Am2903, but is I/O port on Am29203.
2. On Am2903, zero logic is connected to Y, after the $\overline{OE_Y}$ buffer.

MPR-030

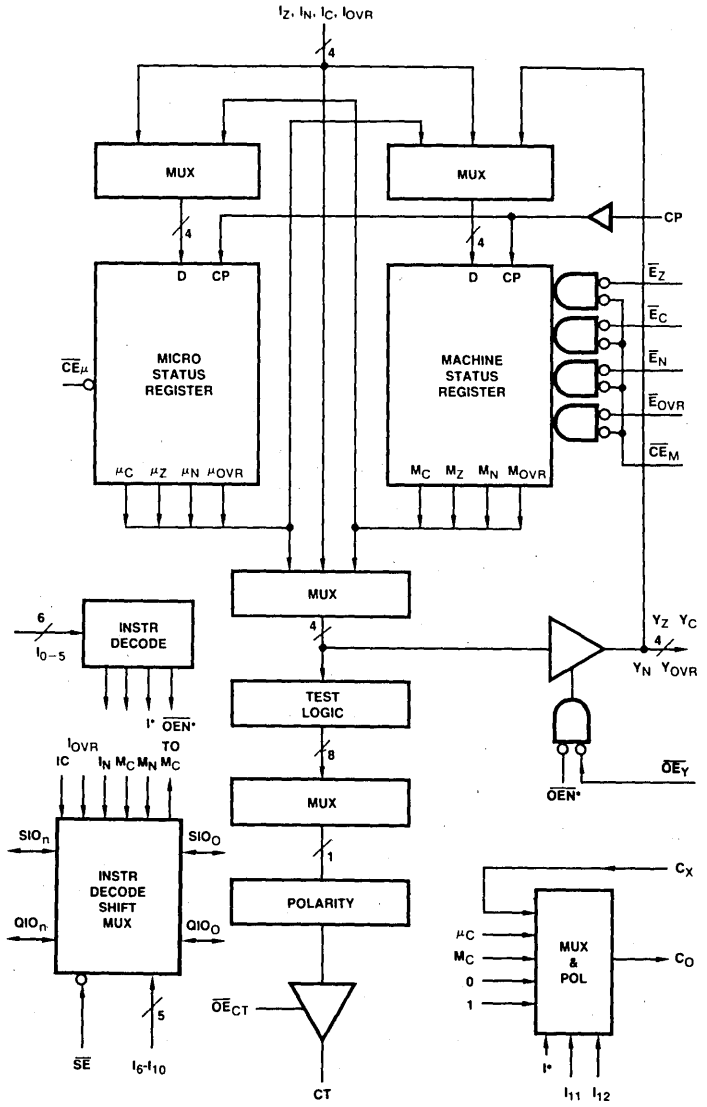
Am2904 Status and Shift Control Unit

- Replaces Most MSI Used around any ALU (including the Am2901B, Am2903 and MSI ALUs)
- Generates Carry-in to the ALU
  Carry signal selectable from seven different sources
- Contains Shift Linkage Multiplexers
  Connects to shift lines at the ends of an Am2901B or Am2903 array to implement single and double length arithmetic and logical shifts
  Rotates 32 different modes
- Contains Two Edge-Triggered Status Registers
  Use for foreground/background registers in controllers or as microlevel and machine level status registers
  Bit manipulating instructions provided
- Condition Code Multiplexer On-Chip
  Single cycle tests for any of 16 different conditions
  Tests performed on either of the two status registers or directly on the ALU output
- 40-Pin DIP



*INTERNAL

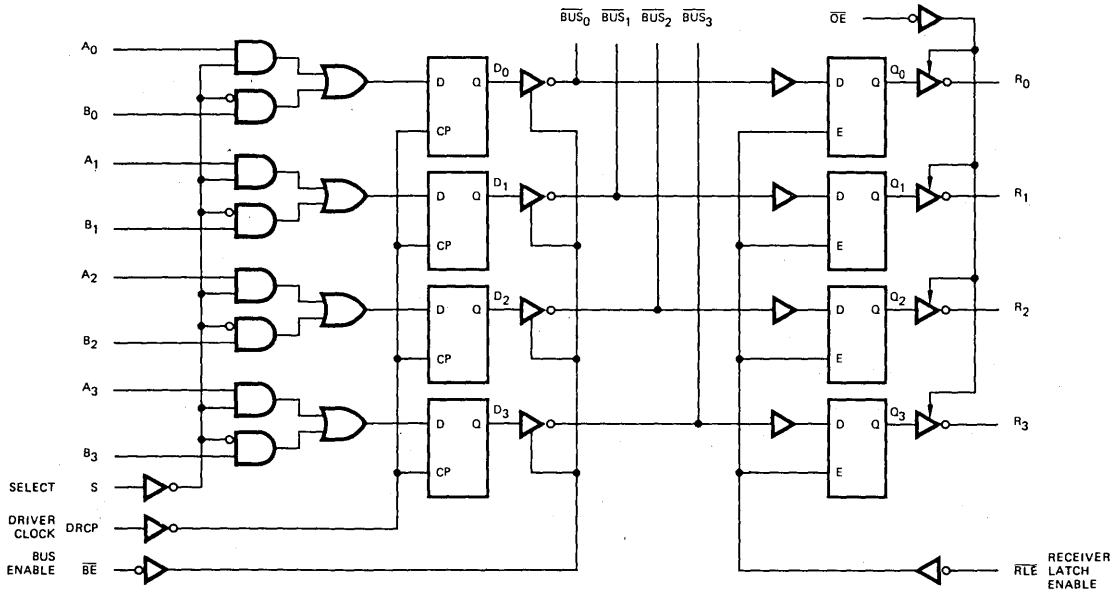
Am2905 Quad 2-Input OC Bus Transceiver (with 3-State Receiver)

- Quad High-Speed LSI Bus Transceiver
- Open-Collector Bus Driver
- 2-Port Input to D-Type Register on Driver
- Bus Driver Output Sinks 100mA at 0.8V (Max)
- Driver Clock to Bus in 21ns (Typ)
- Receiver Has Output Latch for Pipeline Operation
- 3-State Receiver Outputs Sink 12mA
- 24-Pin DIP

Am2906 Quad 2-Input OC Bus Transceiver (with Parity)

- Quad High-Speed LSI Bus Transceiver
- Open-Collector Bus Driver
- 2-Port Input to D-Type Register on Driver
- Bus Driver Output Sinks 100mA at 0.8V (Max)
- Internal Odd 4-Bit Parity Checker/Generator
- Driver Clock to Bus in 21ns (Typ)
- Receiver Has Output Latch for Pipeline Operation
- Receiver Outputs Sink 12mA
- 24-Pin DIP

Am2905*



MPR-065

*Am2906 logic diagram is similar to Am2905 except the $\overline{OE}$ input is replaced with a parity output.

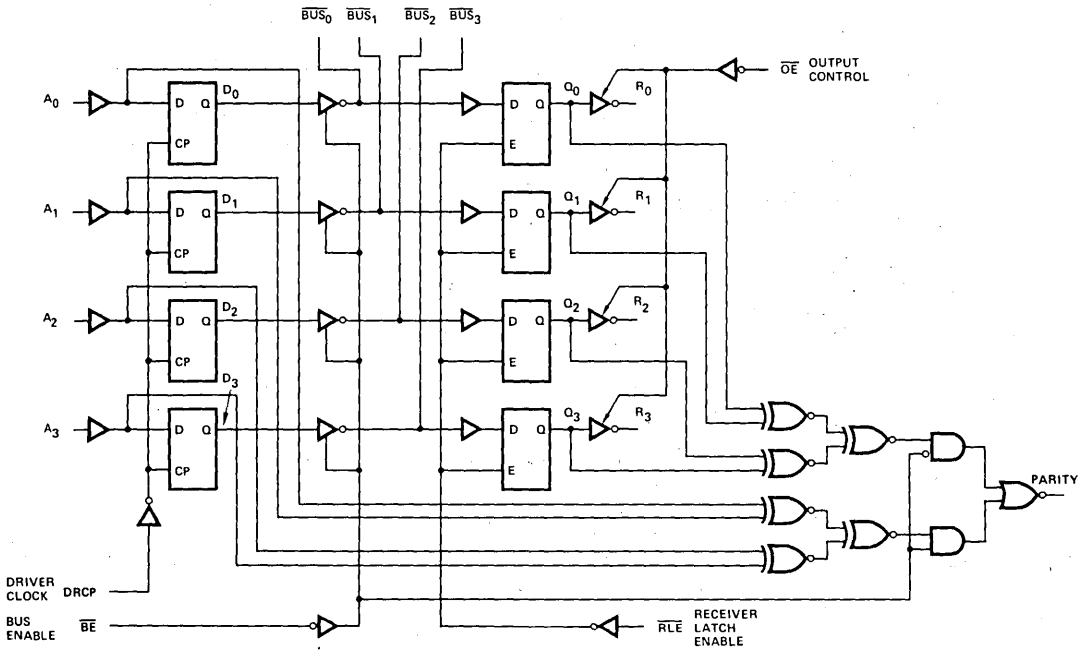
Am2907/Am2908 Quad Bus Transceivers (with Interface Logic)

- Quad High-Speed LSI Bus Transceiver
- Open-Collector Bus Driver
- D-Type Register on Driver
- Bus Driver Output Sinks 100mA at 0.8V (Max)
- Internal Odd 4-Bit Parity Checker/Generator
- Input Receiver Threshold Voltage
  2.0V for Am2907
  1.5V for Am2908 (DEC Q or LSI-11 Bus Compatible)
- Driver Clock to Bus in 21ns (Typ)
- Receiver Has Output Latch for Pipeline Operation
- 3-State Receiver Outputs Sink 12mA
- 20-Pin DIP



MPR-085

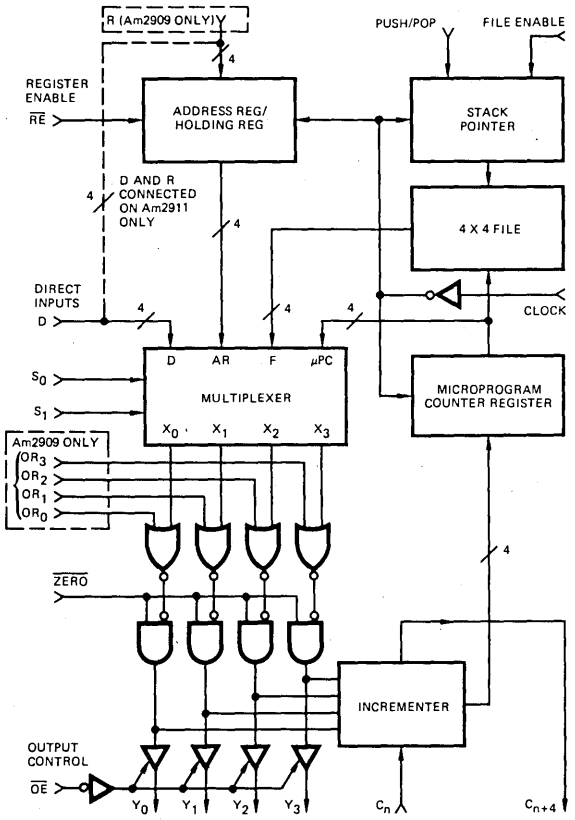
BIPOLAR MICROPROCESSOR PRODUCTS

Am2909/Am2911, Am2909A/Am2911A
4-Bit Microprogram Sequencers

- 4-Bit Slice Cascadable to any Number of Microwords
- Internal Address Register
- Branch Input for N-Way Branches
- Cascadable 4-Bit Microprogram Counter
- 4 x 4 File with Stack Pointer and Push/Pop Control for Nesting Microsubroutines
- Zero Input for Returning to the Zero Microcode Word
- Individual OR Input for each Bit for Branching to Higher Microinstructions (Am2909/Am2909A only)
- 3-State Outputs
- All Internal Registers Change State on the LOW-to-HIGH transition of the Clock
- High-Speed Versions (Am2909A and Am2911A) are Plug-in Replacements for Am2909 and Am2911 Critical Path Speeds Improved by about 25%
- 177ns (Max) for Conditional Jump Sequence (includes delay through PROM and registers)
- Am2909/Am2909A in 28-Pin DIP
- Am2911/Am2911A in 20-Pin DIP

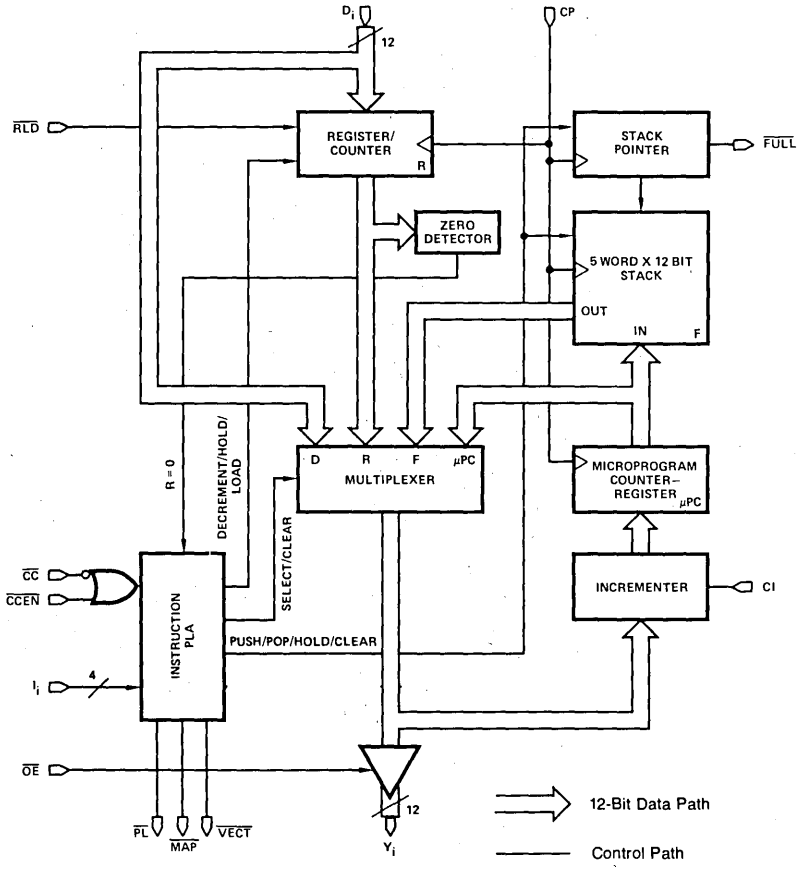


MPR-093

© IC MASTER 1983

Am2910 12-Bit Microprogram Controller

- 12 Bits Wide
  Address up to 4096 words of microcode with one chip
  All internal elements a full 12 bits wide
- Internal Loop Counter
  Presettable 12-bit down-counter for repeating instructions and counting loop iterations
- Four Address Sources
  Microprogram Address can be selected from microprogram counter, branch address bus, 5-level push/pop stack or internal holding register
- 16 Powerful Microinstructions
  Executes 16 sequence control instructions, most conditional on external condition input and/or state of internal loop counter
- Output Enable Controls for Three Branch-Address Sources
  Built-in decoder function enables external devices onto branch address bus, eliminates external decoder
- All Registers Positive Edge-Triggered
  Simplifies timing problems
  Eliminates long set-up times
- Fast Control from Condition Input
  Delay from condition code input to address output 21ns (Typ)
- 166ns (Max) for Conditional Jump Sequence (includes delay through PROM and registers)
- 40-Pin DIP



MPR-106

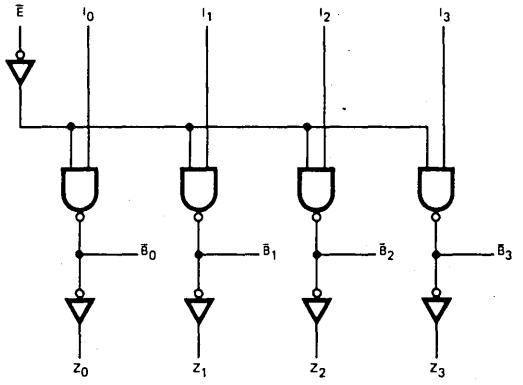
BIPOLAR MICROPROCESSOR PRODUCTS

Am2912 Quad Bus Transceiver

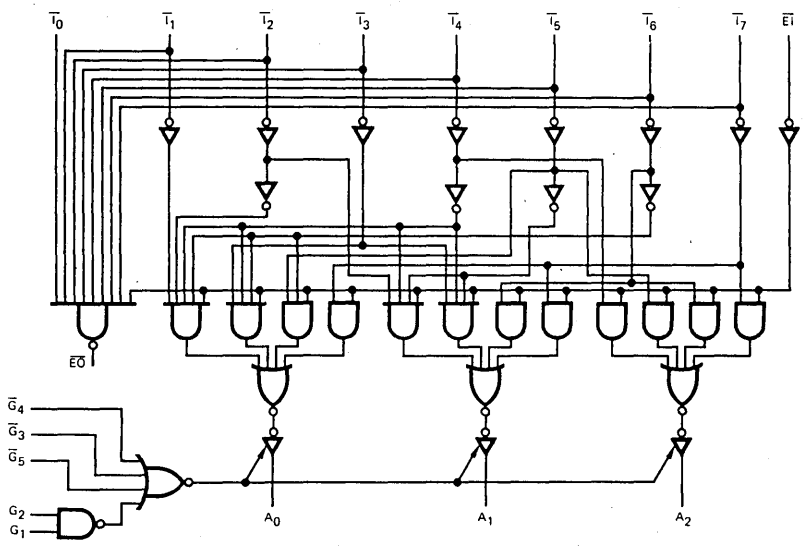
- Input to Bus Is Inverting
- Quad High-Speed Open-Collector Bus Transceiver
- Driver Outputs Sink 100mA at 0.8V (Max)
- Bus Compatible with Am2905, Am2906, Am2907
- Enable to Bus in 14ns (Typ)
- PNP Inputs to Reduce Input Loading
- 16-Pin DIP



BLI-061

Am2913 Priority Interrupt Expander

- Encodes Eight Lines to 3-Line Binary
- Expands Use of Am2914
- Cascadable
- Input to Output in 17ns (Typ)
- Gated 3-State Output
- 20-Pin DIP

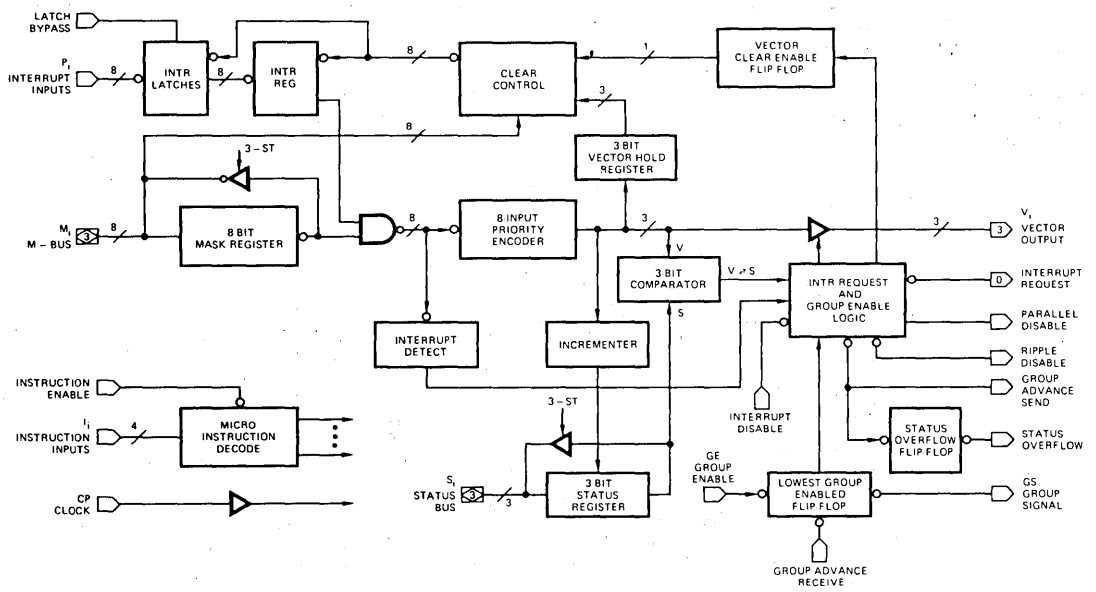


MPR-119

© IC MASTER 1983

Am2914 Vectored Priority Interrupt Controller

- Accepts Eight Interrupt Inputs
  Pulse or level interrupts
  Interrupts stored internally
- Built-in Mask Register
  Six different operations performed on mask register
- Built-in Status Register
  Holds code for lowest allowed interrupt
- Vectored Output
  Output is binary code for highest priority unmasked interrupt
- Expandable
  Any number of Am2914s can be stacked for large interrupt systems
- Microprogrammable
  Executes 16 different microinstructions
  Instruction enable pin aids in vertical microprogramming
- High-Speed Operation
  Delay from interrupt clocked into interrupt register to interrupt request output 97ns (Typ)
- 40-Pin DIP



MPR-124

© IC MASTER 1983

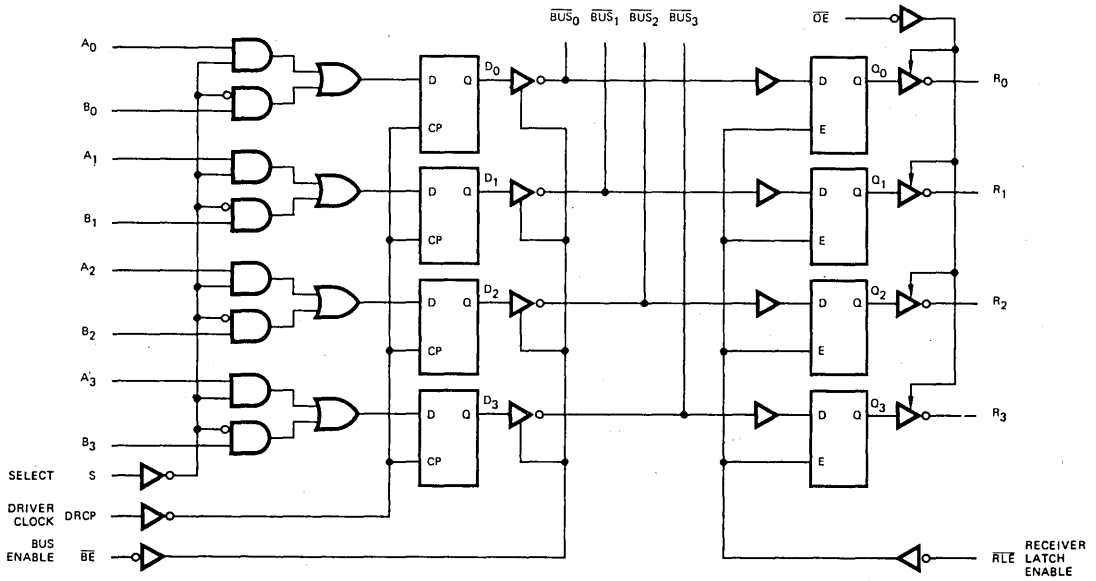
Am2915A Quad 3-State Bus Transceiver (with Interface Logic)

- Quad High-Speed LSI Bus Transceiver
- 3-State Bus Driver
- 2-Port Input to D-Type Register on Driver
- Bus Driver Output Sinks 48mA at 0.5V (Max)
- Receiver Has Output Latch for Pipeline Operation
- Driver Clock to Bus in 21ns (Typ)
- 3-State Receiver Outputs Sink 12mA
- V_{OH} = 3.5V (Min) for Direct MOS Microprocessor Interface
- 24-Pin DIP

Am2916A Quad 3-State Bus Transceiver (with Interface Logic)

- Quad High-Speed LSI Bus Transceiver
- 3-State Bus Driver
- 2-Port Input to D-Type Register on Driver
- Bus Driver Output Sinks 48mA at 0.5V (Max)
- Internal Odd 4-Bit Parity Checker/Generator
- Receiver Has Output Latch for Pipeline Operation
- Driver Clock to Bus in 21ns (Typ)
- Receiver Outputs Sink 12mA
- V_{OH} = 3.5V (Min) for Direct MOS Microprocessor Interface
- 24-Pin DIP

Am2915A*



*Am2916A logic diagram is similar to Am2915A except that $\overline{OE}$ input is replaced by parity output.

MPR-161

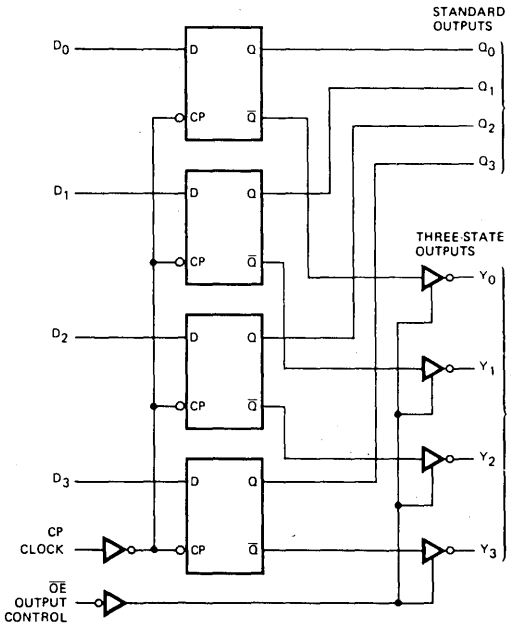
Am2918/Am29LS18 Quad D Registers (with Standard and 3-State Outputs)

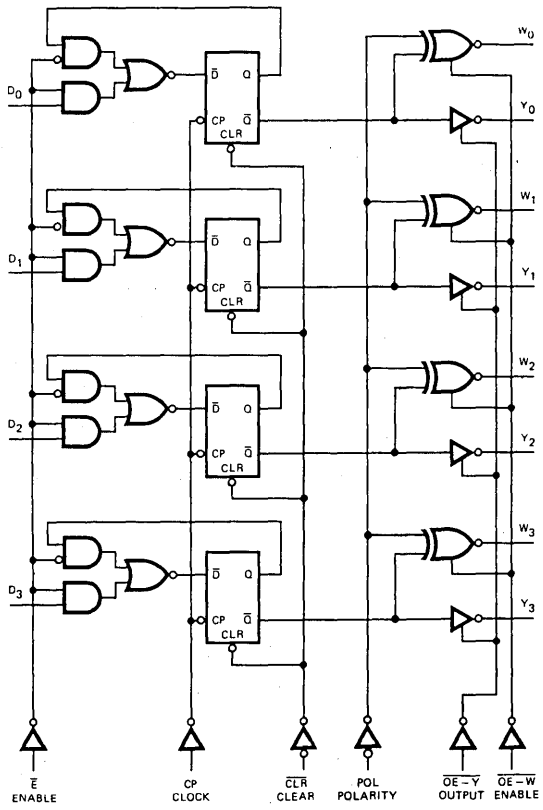
- Four D-Type Flip-Flops
- Four Standard Totem-Pole Outputs
- Four 3-State Outputs
- Clock to Output Time (Typ)
  8.5ns for Am2918
  18ns for Am29LS18
- 16-Pin DIP



MPR-183

Am2919 Quad Register (with Dual 3-State Outputs)

- Two Sets of 3-State Outputs
- Four D-Type Flip-Flops
- Polarity Control on One Set of Outputs
- Buffered Common Clock Enable
- Buffered Common Asynchronous Clear
- Separate Buffered Common Output Enable for each Set of Outputs
- Clock to Output in 22ns (Typ)
- 20-Pin DIP

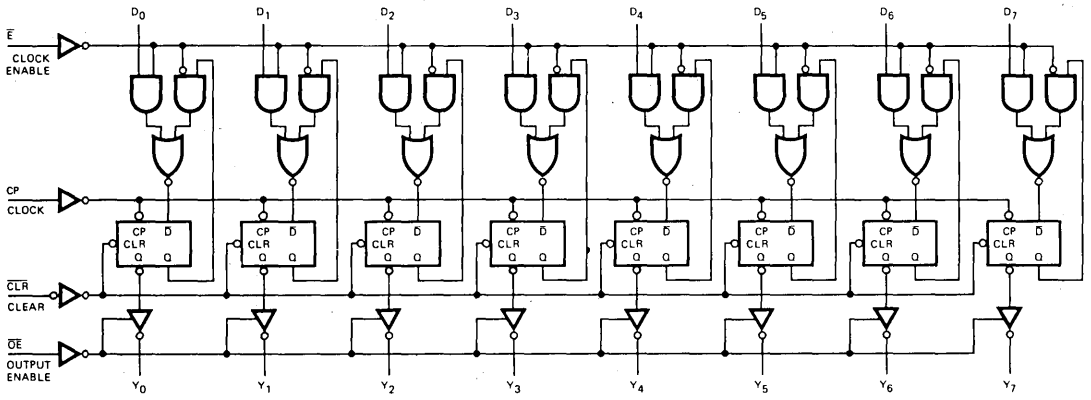


MPR-196

© IC MASTER 1983

Am2920 Octal D-Type Flip-Flop
(with Clear, Clock Enable and 3-State Control)

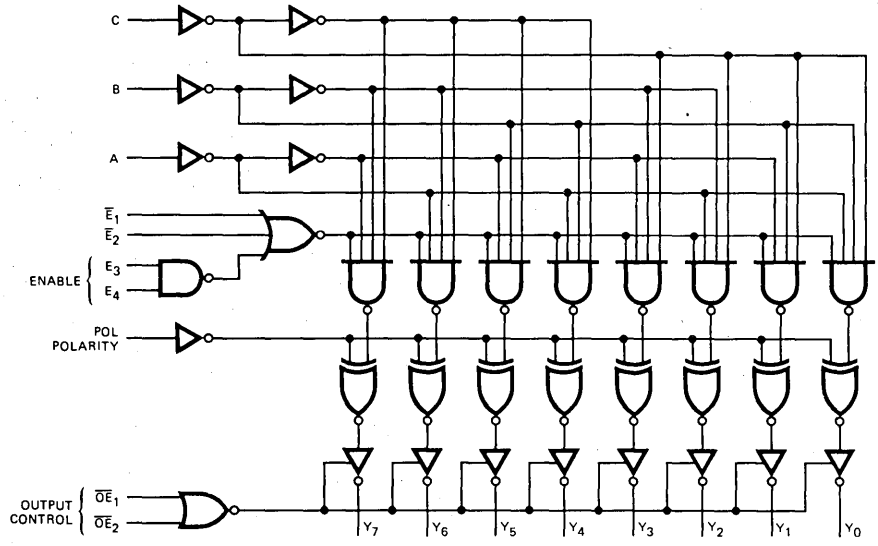
- Buffered Common Clock Enable Input
- Buffered Common Asynchronous Clear Input
- 3-State Outputs
- 8-Bit High-Speed Parallel Register with Positive Edge-Triggered, D-Type Flip-Flops
- Clock to Output in 24ns (Typ)
- 22-Pin DIP



MPR-201

Am2921 One-of-Eight Decoder
(with 3-State Outputs and Polarity Control)

- 3-State Decoder Outputs
- Buffered Common Output Polarity Control
- Inverting and Non-inverting Enable Inputs
- Input to Output in 20ns (Typ)
- 20-Pin DIP

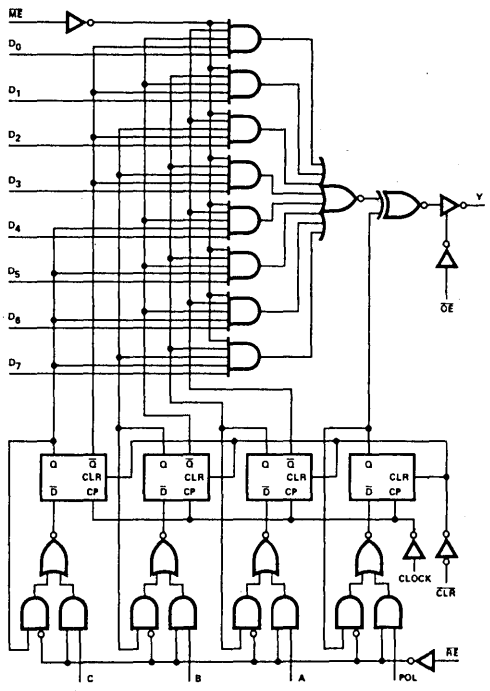


MPR-207

© IC MASTER 1983

Am2922 8-Input Multiplexer (with Control Register)

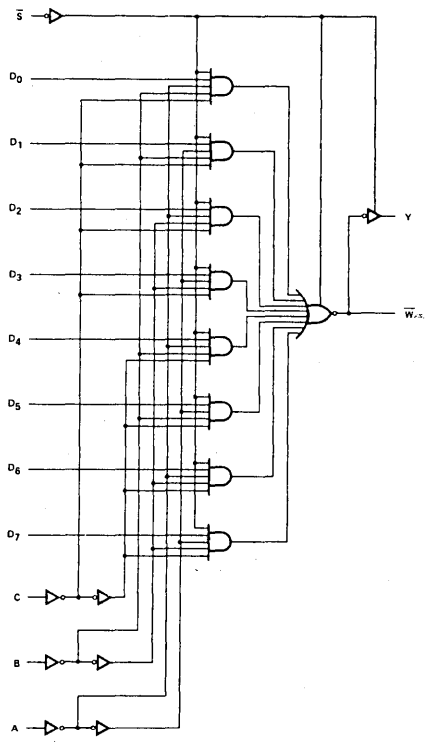
- High-Speed 8-Input Multiplexer
- On-Chip Multiplexer Select and Polarity Control Register
- Output Polarity Control for Inverting or Non-inverting Output
- Common Register Enable
- Asynchronous Register Clear
- 3-State Output for Expansion
- Clock to Output in 21ns (Typ)
- 20-Pin DIP



MPR-213

Am2923 8-Input Multiplexer

- Switches One of Eight Inputs to Two Complementary Outputs
- Input to Output in 13ns (Typ)
- 3-State Output for Bus Organized Systems
- 16-Pin DIP

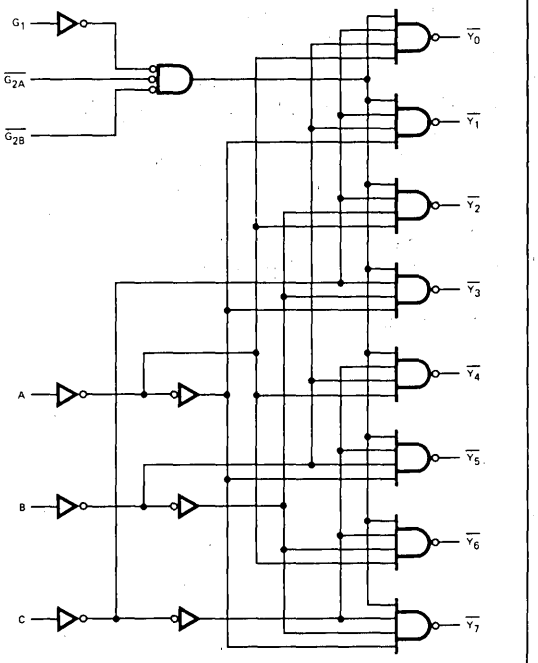


BLI-069

© IC MASTER 1983

Am2924 3-Line to 8-Line Decoder/Demultiplexer

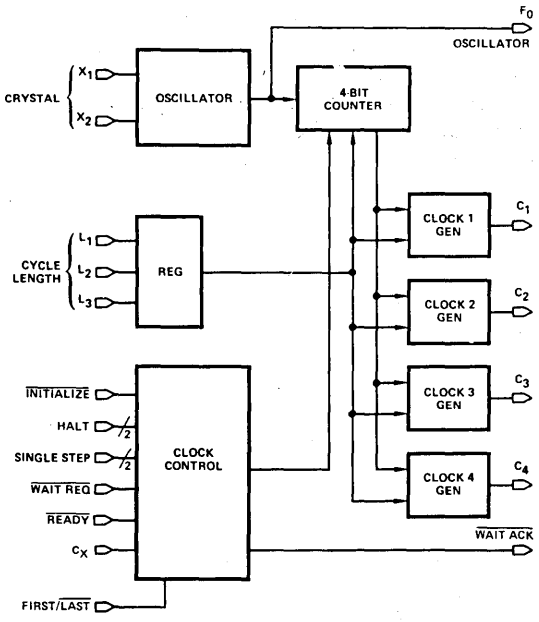
- Inverting and Non-inverting Enable Inputs
- Select to Output in 8.0ns (Typ)
- 16-Pin DIP



BLI-075

Am2925 System Clock Generator and Driver

- Single-Chip Clock Generator and Driver
- Four Different Clock Output Waveforms for Am2900 and Other Bipolar and MOS Systems
- Crystal Controlled for Stable System Operation
- Oscillator to 31MHz
  Oscillator output for external system timing
- Clock Halt, Single-Step and Wait Controls
- Variable Cycle Lengths
  One of eight different cycle lengths can be micro-programmed to boost CPU throughput up to 25%
- Slim 0.3" 24-Pin DIP



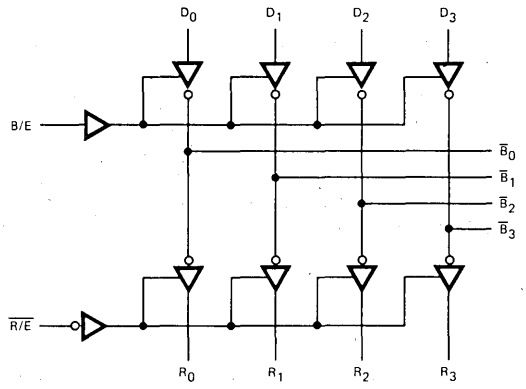
MPR-217

© IC MASTER 1983

Am2926/Am2929 Schottky 3-State Quad Bus Driver/Receiver

- 48mA Driver Sink Current
- 3-State Outputs on Driver and Receiver
- PNP Inputs
- Am2926 Has Inverting Outputs
- Am2929 Has Non-inverting Outputs
- Driver/Receiver Propagation Delay (Typ)
  10ns for Am2926
  13ns for Am2929
- 16-Pin DIP

Am2926*



*Outputs B_0-B_3 are not inverted for Am2929.

BLI-080

Am2927/Am2928 Quad 3-State Bus Transceivers (with Clock Enable)

- Quad High-Speed LSI Bus Transceivers
- 3-State Bus Driver and Receiver Outputs
- D-Type Register on Drivers
- Latched Output on Am2927
- Registered Output on Am2928
- Output Data to Input Wraparound Gating
- Input Register to Output Transfer Gating with or without Driving Data Bus
- Clock Enabled Registers
- Bus Driver Outputs Sink 48mA at 0.5V (Max)
- 3-State Receiver Outputs Sink 20mA at 0.5V (Max)
- V_{OH} = 3.5V (Min) for Direct MOS Microprocessor Interface
- 20-Pin DIP

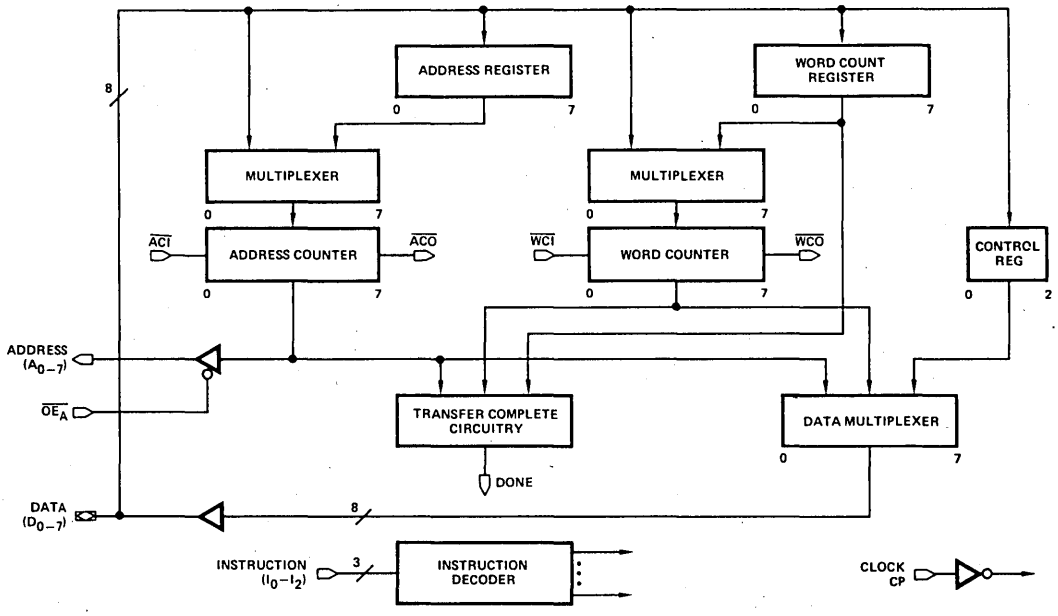
Am2940 DMA Address Generator

- DMA Address Generation
  Generates memory address, word count and DONE signal for DMA transfer operation
- Expandable 8-Bit Slice
  Any number of Am2940s can be cascaded to form larger memory addresses
  Three devices address 16 megawords
- Repeat Data Transfer Capability
  Initial memory address and word count saved so data transfer can be repeated
- Programmable Control Modes
  Provides four types of DMA transfer control plus memory address increment/decrement
- 24mA Output Current Sink Capability
- Microprogrammable
  Executes eight different instructions
- 109ns (Max) Cycle Time for 16-Bit Configuration
  Allows up to nine million words/second DMA
- 28-Pin DIP



MPR-226

© IC MASTER 1983

BIPOLAR MICROPROCESSOR PRODUCTS

Am2942 Programmable Timer/Counter, DMA Address Generator

- 22-Pin Version of Am2940
  Provides multiplexed address and data lines plus additional instruction input and instruction enable pins
- Used as DMA Address Generator or Programmable Timer Counter
- Executes 16 Instructions
  Eight DMA instructions
  Eight Timer/Counter instructions
- Provides Two Independent Programmable 8-Bit Up/Down Counters
  Counters can be cascaded to form single-chip 16-bit up/down counter
- Reinitialize Capability
  Counters reinitialized from on-chip registers
- Expandable 8-Bit Slice
  Any number of Am2942s can be cascaded
  Three devices provide a 48-bit counter
- Programmable Control Modes
  Four types of control
- 24mA Output Current Sink Capability
- 109ns (Max) Cycle Time for 16-Bit Configuration
- 22-Pin DIP

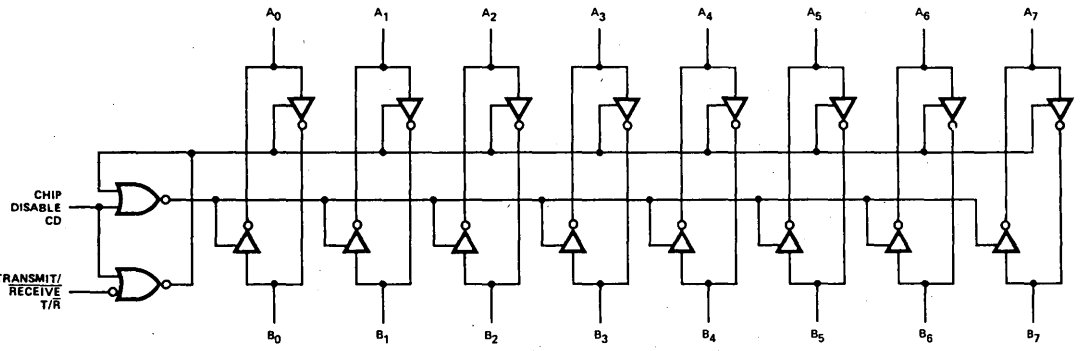
Am2946/Am2947 Octal 3-State Bidirectional Bus Transceivers

- 8-Bit Bidirectional Data Flow Reduces System Package Count
- 3-State Inputs/Outputs for Bus-Oriented System Interface
- PNP Inputs Reduce Input Loading
- $V_{OH} = V_{CC} - 1.15V$ for TTL, MOS, CMOS Interface
- 48mA, 300pF Bus Drive Capability
- Am2946 Has Inverting Transceivers
- Am2947 Has Non-inverting Transceivers
- Transmit/$\overline{\text{Receive}}$ and Chip Disable Simplify Control Logic
- Low-Power
  8.0mA per bidirectional bit
- Bus Port Stays in High-Impedance State during Power Up/Down
- A Port to B Port Delay Time – 11ns (Typ)
- 20-Pin DIP

Am2946*



*Am2947 has non-inverting transceivers. BLI-101

Am2948/Am2949 Octal 3-State Bidirectional Bus Transceivers

- 8-Bit Bidirectional Data Flow Reduces System Package Count
- 3-State Inputs/Outputs for Bus-Oriented System Interface
- PNP Inputs Reduce Input Loading
- $V_{OH} = V_{CC} - 1.15V$ for TTL, MOS, CMOS Interface
- 48mA, 300pF Bus Drive Capability
- Am2948 Has Inverting Transceivers
- Am2949 Has Non-inverting Transceivers
- Separate $\overline{\text{Transmit}}$ and $\overline{\text{Receive}}$ Enables
- Low-Power
  8.0mA per bidirectional bit
- Bus Port Stays in High-Impedance State during Power Up/Down
- 20-Pin DIP

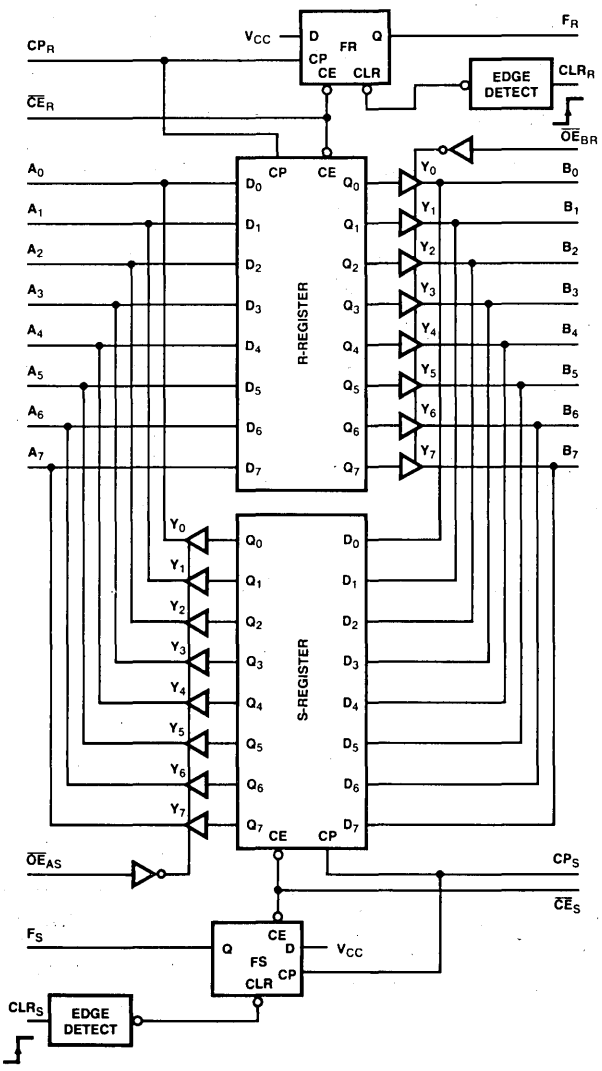
Am2950/Am2951 8-Bit Bidirectional I/O Ports

- 8-Bit, Bidirectional I/O Port with Handshake
  Two 8-bit, back-to-back registers store data moving in both directions between two bidirectional busses
- Register Full/Empty
  On-chip flag flip-flops provide data transfer handshaking signals
- Separate Clock, Clock Enable and 3-State Output Enable for each Register
- Separate, Edge-Sensitive Clear Control for each Flag Flip-Flop
- Inverting and Non-inverting Versions
  Am2950 provides non-inverting data outputs
  Am2951 provides inverting data outputs
- 24mA Output Current Sink Capability
- 20ns Clock to Flag, 27ns (Max) for Output Enable
  Allows up to 8 million words/second data transfer rate
- 28-Pin DIP

Am2950*



*Outputs B_0-B_7 are inverted on the Am2951.

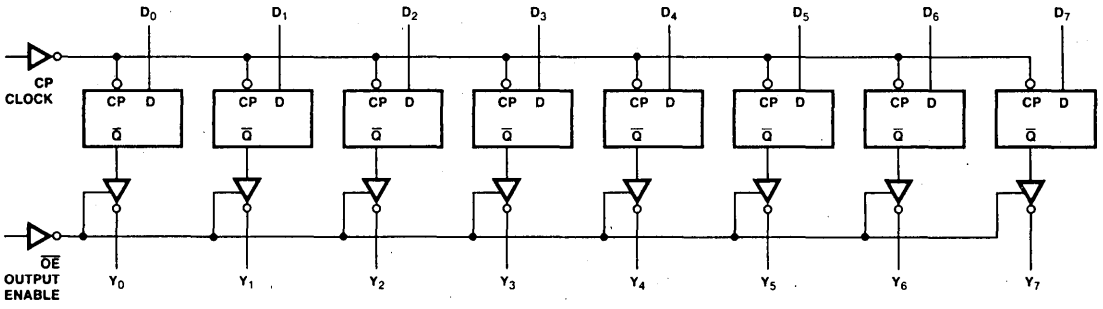
Am2954/Am2955 Octal Registers (with 3-State Outputs)

- 8-Bit High-Speed Parallel Registers
- Am2954 Has Non-inverting Inputs
- Am2955 Has Inverting Inputs
- Positive Edge-Triggered D-Type Flip-Flops
- Buffered Common 3-State Control and Clock
- V_{OL} = 0.5V (Max) at I_{OL} = 32mA
- Clock to Output 11ns (Typ)
- 20-Pin DIP

Am2954*

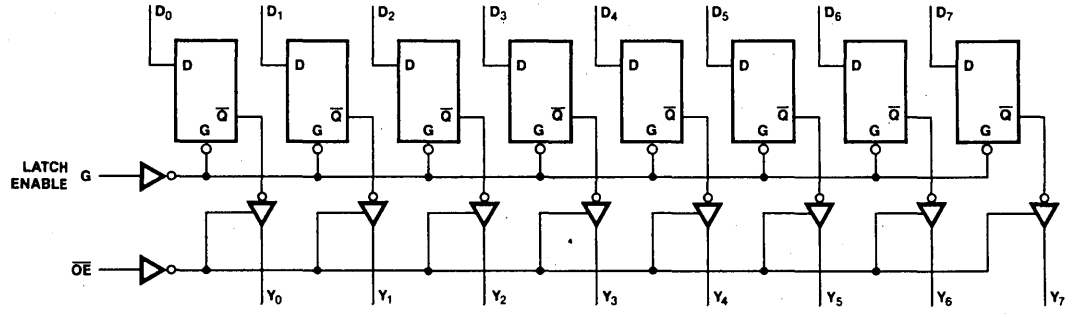


*Inputs D_0 through D_7 are inverted on the Am2955. BLI-110

Am2956/Am2957 Octal Latches (with 3-State Outputs)

- Eight Latches in a Single Package
- Am2956 Has Non-inverting Outputs
- Am2957 Has Inverting Outputs
- V_{OL} = 0.5V (Max) at I_{OL} = 32mA
- 3-State Outputs for Bus-Oriented System Interface
- Hysteresis on Latch Enable Input for Improved Noise Margin
- Clock to Output 12ns (Typ)
- 20-Pin DIP

Am2956*



*Inputs D_0 through D_7 are inverted on the Am2957. MPR-360

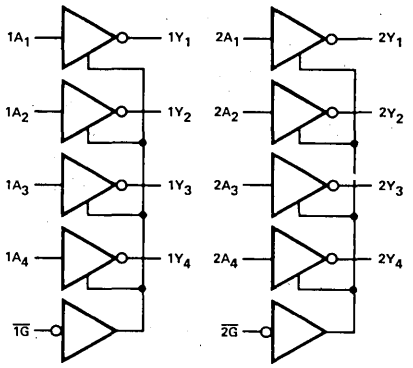
Am2958/Am2959 Octal Buffers/Line Drivers/Line Receivers (with 3-State Outputs)

- 3-State Outputs Drive Bus Lines Directly
- Hysteresis at Inputs Improve Noise Margin
- PNP Inputs Reduce dc Loading on Bus Lines
- V_{OL} = 0.55V
  at I_{OL} = 65mA for commercial product
  at I_{OL} = 48mA for military product
- Data-to-Output Propagation Delay
  Am2958 Inverting – 4.5ns (Max)
  Am2959 Non-inverting – 6.0ns (Max)
- Enable-to-Output 15ns (Max)
- 20-Pin DIP

Am2958*



*Outputs Y_1 through Y_4 are not inverted on the Am2959.

BLI-115

Am29112 Interruptable 8-Bit Microprogram Sequencer

- Fast
  Designed to operate in 10MHz microprogrammed systems
- Expandable
  One Am29112 directly addresses up to 256 words of microcode
  Two Am29112s can directly address up to 64K words of microcode
- Interruptable at Microcycle Completion
  Internal states saved on the stack
  Branches automatically to the interrupt service routine
- Many Addressing Modes
  Immediate, relative and n-way addressing
- 31-Level Stack
  On-chip 31-level stack used for subroutines, interrupts and loops
- Single or Double Pipeline
- 40-Pin DIP

Am29116 16-Bit Bipolar Microprocessor

- Designed for Controller Applications
  Instruction set designed for high performance peripheral controllers, communications controllers, industrial controllers and digital modems . . . but general purpose too.
  Excellent solution for applications requiring speed and bit-manipulation power
- Fast
  Design objective of 100ns (Max) microcycle time for all instructions
  Allows a 10MHz clock rate
- Powerful Instruction Set
  All instructions executable in single cycle on full 16-bit word or on 8-bit byte:

Add, Subtract	Rotate and Merge
n-Bit Rotate	Rotate and Compare
Shift-Up/Shift-Down	CRC Generation
Set-Bit/Reset-Bit	Priority Encode
Add/Subtract 2^n	

- Powerful Data Manipulation
  Full 16-bit data path
  32 registers on-chip
  Direct data input for immediate mode instructions
- 52-Pin DIP

DESIGN AIDS

AmSYS™29 Microprogram Development System

The AmSYS™29 is a complete development system for microprogrammed machines. It is a useful tool for designing initial hardware/firmware, for assembling and debugging microcode and for checking out hardware.

AmSYS™29 includes a CP/M compatible operating system, 2Kx64 bit words of high-speed Writable Control Store and high-speed Emulation Control Logic. The options and peripherals offer a high-speed trace, line printer, PROM programmer interface and CRT console.

Features:

- AMDASM meta-assembler language definition and source file assembly
- High-Speed Emulator integrating bipolar logic and microcode
- High-Speed Writable Control Store
- Optional 10-MHz High-Speed Microcode Trace
- AmDOS29 CP/M compatible disk operating system
- Dual single-density floppy disk drives upgradable to double density

Am2900 Learning and Evaluation Kit

The Am2900 Learning and Evaluation Kit provides a stripped-down model of a typical microprogrammed controller or computer for introducing engineers to the architecture of microprogrammed systems.

It contains a small but powerful microprogrammed control unit driving several data handling elements including an Am2901B 4-bit CPU slice. The microprogram memory in the kit is a read/write memory so that sequences of microinstructions can be entered by the user, then executed. The data control portion of each microinstruction controls all inputs to the Am2901B, shift and rotate logic and a status register that captures ALU conditions following each cycle. Each microinstruction also contains a 4-bit sequence control field, which is used to select one of 16 different sequence control instructions and a branch address. The instructions are decoded in a PROM that controls an Am2909 microprogram sequencer. Once entered, microinstructions may be executed using a single-step clock or a pulse generator.

The Am2900 Learning and Evaluation Kit includes 40 integrated circuits, 26 resistors, 16 capacitors, 15 switches, 12 LEDs and the PC board. The only item not supplied is a 5V, 2A power supply. Also included is the user's manual, a 114-page book containing chapters on the theory of microprogramming, the assembly and testing of the kit and exercises that demonstrate the application of the architecture and operation of the Am2901B and Am2909.

Bit-Slice Microprocessor Design

This 384-page book is invaluable as a learning tool or reference manual. Authored by AMD, the text discusses in detail the design of a microprogrammed computer using the Am2900 Family. Application examples are used extensively and theory is pared to essentials. Chapters include:

I – Computer Architecture
II – Microprogrammed Design
III – The Data Path
IV – The Data Path, Part Two
V – Program Control Unit
VI – Interrupt
VII – Direct Memory Access
VIII – The HEX-29 Single-Board Computer
IX – The Super Sixteen Single-Board Computers

Bit-Slice Microprocessor Design by J. Mick and J. Brick, ISBN 0-07-041781-4, may be obtained from your local bookstore or ordered directly from McGraw-Hill Book Co., Suite 26-1, 1221 Avenue of Americas, New York, NY 10020.

AMD School of Advanced Engineering

The AMD School of Advanced Engineering offers three courses for the Am2900 Family designer: Introduction to Designing with the Am2900 Family, Microprogrammable Computer Architecture and Introduction to Design with a Development System. Comprehensive course notes are available without course attendance for a fee of $175.00/set. MOS MICROPROCESSOR PRODUCTS

At Last. A True Alternate Source for the Complete iAPX86 Family.

The new ***AMD-Intel Alliance*** is finally bringing true alternate sourcing to the iAPX86 market. We are bringing you the full iAPX86 Family. The 8086 and 8088 CPUs. The 186 and 286 upgrades. The 8087 Coprocessor. The 8089 I/O Processor. Plus all the peripherals. All of them. At a competitive price, with competitive delivery. See our product line-up for details.

AMD's iAPX86 Parts are 100% Compatible with the Intel Series.

Fully compatible. Function for function, pin for pin. Intel provides us with the specs, the layouts, and the process "recipe". This includes all upgrades, on all parameters. It's in the contract, committed for 10 years. So no more sole-source anxieties. Now you always have a choice.

No More Incoming Test Problems. We have the Tapes.

There's added insurance that our AMD parts will fit your iAPX86 sockets. The ***AMD/Intel Alliance*** gives us the Intel test tapes. Which means that if ***their*** parts pass your incoming test, ours will. In fact, with the INT-STD-123 quality guarantee, the AMD parts should do even better. No QA hassles, no tape correlation problems, no failure analyses. We do it right the first time.

We Bring Something Else to the Party.

AMD's high-performance peripherals bring added punch to your microprocessor system. The Am9511A and Am9512 Arithmetic Processors, the Am9517A DMA Controller – these devices are so outstanding that Intel is second-sourcing them from us. You've seen our other Am9500 wizards on your parts lists before. The Am9513A System Timing Controller, the Am9518 Data Ciphering Processor, the Am9520 Burst Error Processor and the 9519A Priority Interrupt Controller. We also bring other sophisticated chips to the iAPX86 world. The 8036 Counter I/O Port, the 9516 DMA Transfer Controller, the 8030/8530 Serial Communications Controller, and the 8038 FIFO I/O. Superior parts. From the superior source.

Interface, Memory, and Bipolar Support. We Have It All.

AMD is a full-line semiconductor supplier. We will fill your entire iAPX86 system parts list, from a complete set of support parts. Our Am2900 Family, Am29800 series, and Am25LSXX bipolar parts for microprocessors are the fastest in the business. Bipolar memory? We have it! MOS RAMs, EPROMs? We have them! iAPX86 support, across the board. One-stop shopping for your whole microprocessor package.

Advanced Micro Devices

MOS MICROPROCESSOR PRODUCTS

Co-Development on Advanced iAPX86 Parts.

AMD and Intel have combined their R&D talent to introduce a series of ever-more-advanced iAPX86 peripherals over the next few years. High-performance peripherals. Special purpose controllers. Software and firmware. The upward path to 32 bits and beyond. With AMD as your iAPX86 source, you can tell your design engineers that you've got guaranteed access to ***all*** of these advanced parts. Outside of the ***Alliance***, nobody else can offer you this. Nobody.

Delivery. When We Promise It. When You Need It.

We are building the iAPX86 Family parts in our ultra-modern fabrication plant in Austin, Texas. Our state-of-the-art process assures you of consistent, quality parts. Our new wafer line ensures high yields in the quantities you need. If you're concerned about stable long-term supply, we are the only iAPX86 alternate source that produces in the USA. We compete by keeping our delivery commitments. We serve just one master in this market – our customers.

Outstanding Field and Factory Support.

One of the benefits of real competition is a responsive sales force. When you call, we answer you. You have a problem, we scramble to find a solution. On ***your*** terms. Our salesmen and field engineers are experienced in iAPX86-based designs. Our reps and our distributors fill out the AMD service network, giving on-the-spot stocking and delivery, wherever you need it. We figure that tough competition is the only way to ensure superior service. After all, you remember that we're the people who introduced a choice to the 8080 and 8085 markets. Now it's time to bring it to the iAPX86 market.

International Standard 123: AMD Quality That Nobody Can Touch.

You get the finest product assurance in the industry. All of our parts are tested to MIL-STD-883. We guarantee AQLs of 0.3% or better on all our microprocessor parts, all package types. Nobody else can touch these quality guarantees. AMD spent millions last year to be able to guarantee you these quality levels on every shipment. That's ***serious*** competition.

We Want Your Business.

Competition means we hustle to serve you in the new iAPX86 world. An alternate source for the entire iAPX86 Family of parts. 100% compatible. Competitive price and delivery. First class quality and outstanding field service. We compete on all these dimensions because we want your business. Advanced Micro Devices. ***We offer you a choice.***

*Q3-4 1982 Introduction
**1983 Introduction
***1984 Introduction

The AMD/INTEL Alliance.

In September, 1981, Advanced Micro Devices and Intel reached an agreement to work together supporting Intel's iAPX Family of microprocessors, beginning with the 8086. A milestone in semiconductor history, the agreement, like many "cross license" pacts in the industry, calls for mask exchanges between the two companies. However, unlike many agreements, it also calls for a process technology and test program exchange. And, unlike anything that has preceded it, the alliance defines the exchange not only in terms of products but in terms of time.

For the next decade, every microprocessor product designed by AMD or Intel will be available to the other party, guaranteeing two US-based suppliers for the iAPX86 product family. To ensure the widest variety of peripherals, the two companies will combine resources to develop new product definitions. Rarely is an agreement struck between two companies that offers so much to so many: two coordinated design centers, two suppliers of exactly identical parts, and all upgrades and extensions automatically included.

During the ten-year lifetime of the technology exchange, AMD and Intel will continue to supply iAPX microprocessor users with more effective and more efficient tools to satisfy their increasingly sophisticated applications.

Advanced Micro Devices and Intel make the iAPX processors the most thoroughly supported microprocessor family in the world.

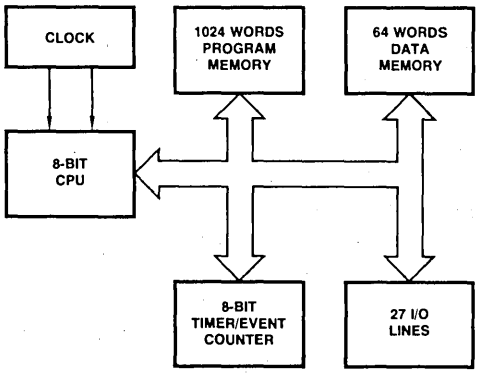
MICROCOMPUTERS

Am8048/Am8035 Single-Chip 8-Bit Microcomputers

The Am8048 and Am8035 are single-chip, 8-bit microcomputers designed for use as efficient controllers. The Am8048 contains an 8-bit CPU, a 1K x 8 ROM Program Memory, a 64 x 8 RAM Data Memory, 27 I/O lines, an 8-bit Timer/Event Counter and on-board oscillator and clock circuits. Standard memory devices and Am8080A/Am9080A peripherals can be added for systems requiring expanded memory and I/O capability. The Am8035 is the equivalent of the Am8048 except that it has no internal program memory.

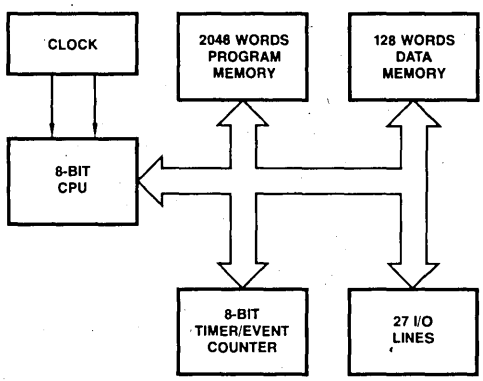
Both microcomputers have extensive bit-handling capability as well as facilities for both binary and BCD arithmetic. The instruction set contains over 90 instructions: 70% are single byte, the balance are two bytes. All instructions can be executed in one or two cycles; both 2.5μs and 4.17μs cycle versions are available. The Am8048 and Am8035 require a single, 5V supply and are available in either a plastic or hermetic 40-pin DIP.



Am8049/Am8039 Single-Chip 8-Bit Microcomputers

The Am8049 and Am8039 are single-chip, 8-bit microcomputers designed for use as efficient controllers. The Am8049 contains an 8-bit CPU, a 2K x 8 ROM Program Memory, a 128 x 8 RAM Data Memory, 27 I/O lines, an 8-bit Timer/Event Counter and on-board oscillator and clock circuits. Standard memory devices and Am8080A/Am9080A peripherals can be added for systems requiring expanded memory and I/O capability. The Am8039 is the equivalent of the Am8049 except that is has no internal program memory.

Both microcomputers have extensive bit-handling capability as well as facilities for both binary and BCD arithmetic. The instruction set contains over 90 instructions: 70% are single byte, the balance are two bytes. All instructions can be executed in one or two cycles; both 1.36μs and 2.5μs cycle versions are available. The Am8049 and Am8039 require a single, 5V supply and are available in either a plastic or hermetic 40-pin DIP.



© IC MASTER 1983

CENTRAL PROCESSING UNITS

Am8080A/Am9080A 8-Bit Central Processing Unit (CPU)

The Am8080A/Am9080A is an 8-bit parallel central processing unit designed to perform a wide variety of operations, ranging from complex arithmetic calculations to character handling to bit control. Various speed options, including a high speed version with a 1.0μs instruction cycle time, are available.

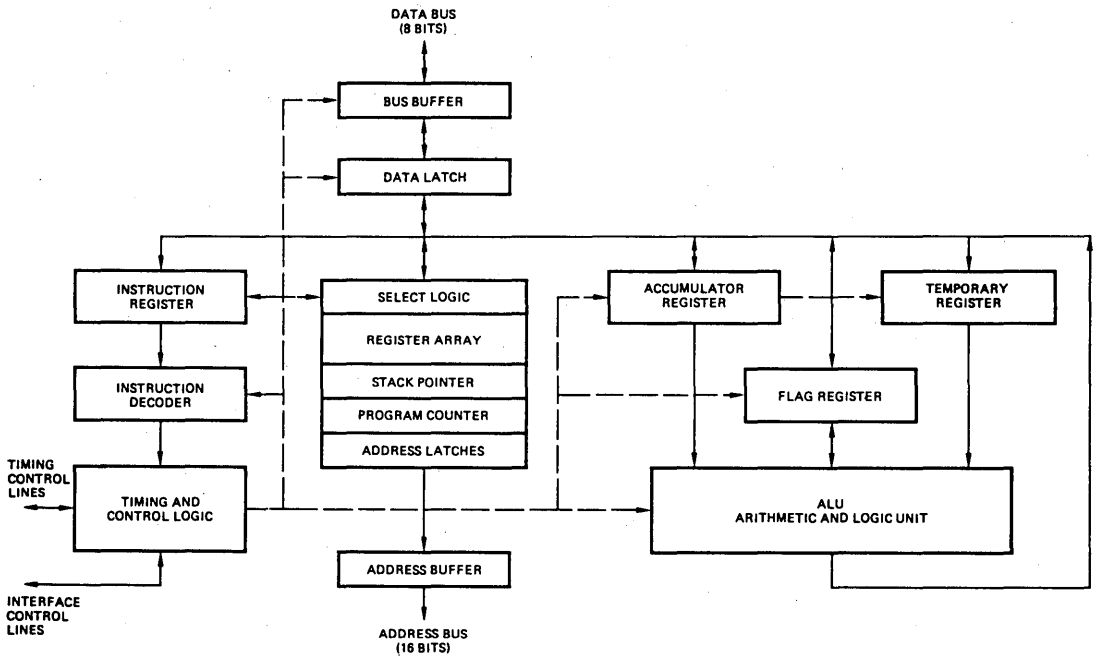
The CPU contains a 16-bit Program Counter which can directly address up to 64K bytes of memory through the 16-line address bus. The addressed memory may be any combination of read/write and read-only. A separate 8-line bidirectional data bus transfers instructions, data and status information between system devices. All transfers are handled using asynchronous handshaking controls so that any speed memory or I/O device is easily accommodated. Data and address busses may be OR-tied with other controlling devices for direct memory access or multiprocessor operation.

An accumulator plus six general-purpose registers are available to the programmer. The six registers are each eight bits long and may be used singly or in pairs for both 8 and 16-bit operations. The accumulator forms the primary working register and is the destination for many of the arithmetic and logic operations.

A general-purpose push-down stack is an important part of the microprocessor system architecture. The contents of the stack reside in R/W memory; an on-chip 16-bit Stack Pointer controls the addressing of this external stack. Subroutine call and return instructions automatically use the stack to store and retrieve the contents of the accumulator, flags, program counter and all of the six general-purpose registers. Push and Pop instructions allow direct use of the stack for storing operands, passing parameters and saving machine state.

An asynchronous vectored interrupt capability is included to allow external signals to modify the instruction stream. The interrupting device may specify an interrupt instruction to be executed and may thus vector the program to a particular service location, or to perform some other direct function.

The Am8080A/Am9080A is available in either a plastic or hermetic 40-pin DIP.

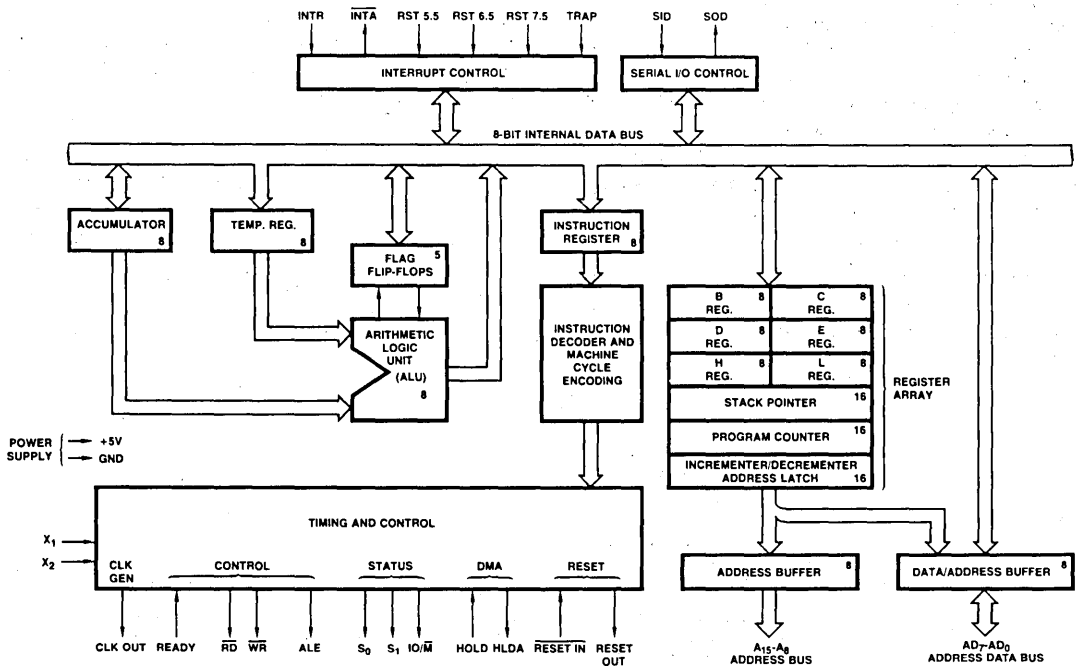


© IC MASTER 1983

Am8085A 8-Bit Central Processing Unit (CPU)

The Am8085A is an advanced, complete 8-bit parallel central processing unit. It is available with either 1.3μs or 0.8μs instruction cycle time and is 100% software compatible with the Am8080A/Am9080A.

The Am8085A incorporates a clock generator and system controller on-chip, thereby offering a high level of system integration. Additional enhancements include interrupt control logic, consisting of four vectored interrupts, and serial I/O lines. The Am8085A uses a multiplexed data bus. The address is split between the 8-bit address bus and the 8-bit data bus. Up to 64K bytes of memory can be directly addressed. The CPU requires a single, 5V supply and is available in either a plastic or hermetic 40-pin DIP.



© IC MASTER 1983

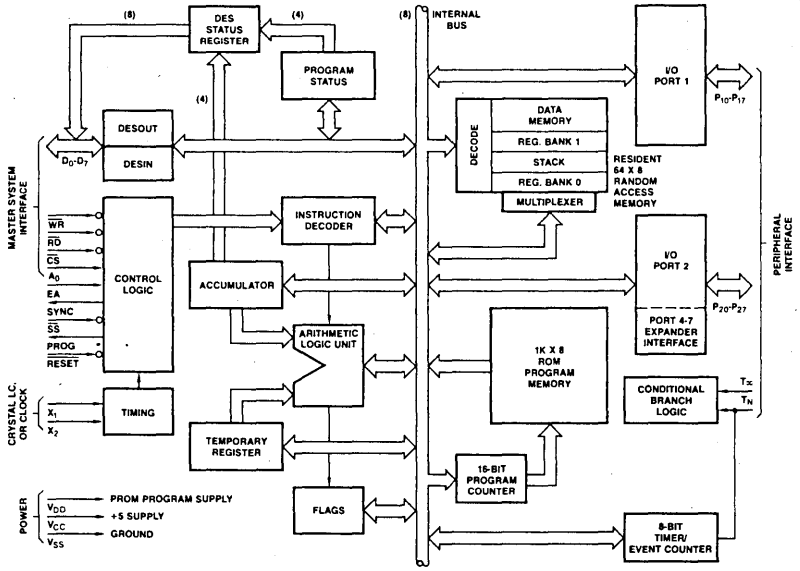
PERIPHERAL DEVICES

Am8041A Universal Peripheral Interface

The Am8085A is an advanced, complete 8-bit parallel central processing unit. It is available with either 1.3μs or 0.8μs instruction cycle time and is 100% software compatible with the Am8080A/Am9080A.
than conventional LSI interface devices.

The Am8041A contains 1K x 8 ROM Program Memory, 64 x 8 RAM Data Memory, an 8-bit CPU, 16 I/O lines, an 8-bit programmable Timer/Event Counter, clock and interface registers. The UPI has two 8-bit I/O ports and two test inputs. Individual port lines can function as either inputs or outputs under software control. The timer/event counter generates timing sequences or counts external inputs.

The Am8041A requires a single, 5V supply and is available in either a plastic or hermetic 40-pin DIP.

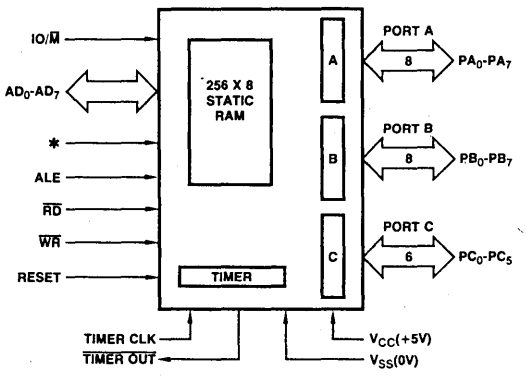


Am8155/Am8156 RAM with I/O Ports and Timer

The Am8155 and Am8156 static RAMs with I/O ports and timer are designed to directly interface with the Am8085A CPU in an 8-bit microprocessor system. They differ only in the polarity of the Chip Enable (CE) input: active-LOW for the Am8155, active-HIGH for the Am8156.

The RAM portion, 2K-bit static cells organized as 256 x 8, has a maximum access time of 400ns, thus requiring no wait states in the Am8085A CPU. The I/O portion consists of three general-purpose I/O ports. One port can be programmed to act as status pins, thus allowing the other two ports to operate in a handshake mode. An on-chip, programmable counter/timer provides either a square wave or terminal count pulse for the CPU, depending on the timer mode.

The Am8155 and Am8156 are also available in a higher speed version. Both require a single, 5V supply and are packaged in a plastic or hermetic 40-pin DIP.



*Am8155 = $\overline{CE}$, Am8156 = CE.

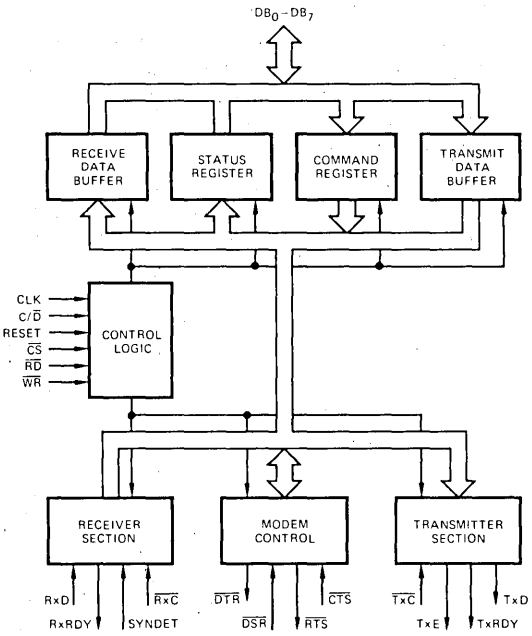
© IC MASTER 1983

Am8251/Am9551 Universal Synchronous/ Asynchronous Receiver/Transmitter (USART)

The Am8251/Am9551 is a programmable serial data communications interface that provides a universal synchronous/asynchronous receiver/transmitter function. It is normally used as a peripheral device for an 8-bit microprocessor system and may be programmed by the CPU to operate in a variety of standard serial communication formats.

Data, control, operation and format options are all selected by commands from the CPU. The USART can operate in an independent full duplex mode. It accepts parallel data from the CPU, formats and serializes the information based on its current operating mode, and then transmits the data as a serial bit stream. Simultaneously, serial data can be received, converted into parallel form, de-formatted, and then presented to the CPU. The Am8251/Am9551 is doubled buffered and can operate at clock frequencies of up to 2.8MHz.

The USART requires a single, 5V supply and is available in a 28-pin plastic or hermetic DIP.

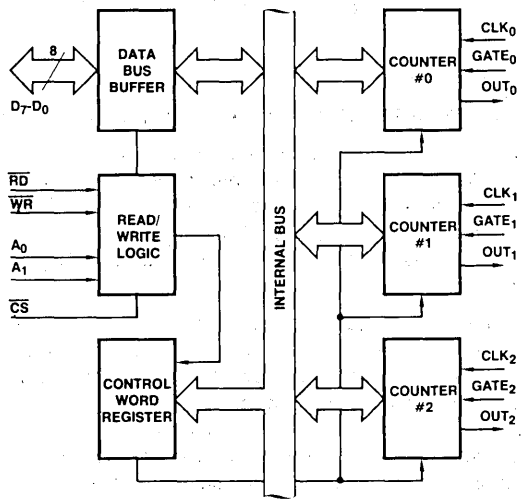


Am8253 Programmable Interval Timer

The Am8253 programmable interval timer/counter functions as a general-purpose, multitiming element in Am8080A/Am9080A and Am8085A microprocessor systems.

It is organized as three independent 16-bit counters, each with a count rate of up to 2.5MHz. A faster device, Am8253-5, allows full compatibility with the Am8085A. All modes of operation are software programmable.

The Am8253 requires a single, 5V supply and is available in a plastic or hermetic 24-pin DIP. For improved performance, see the Am9513 System Timing Controller.



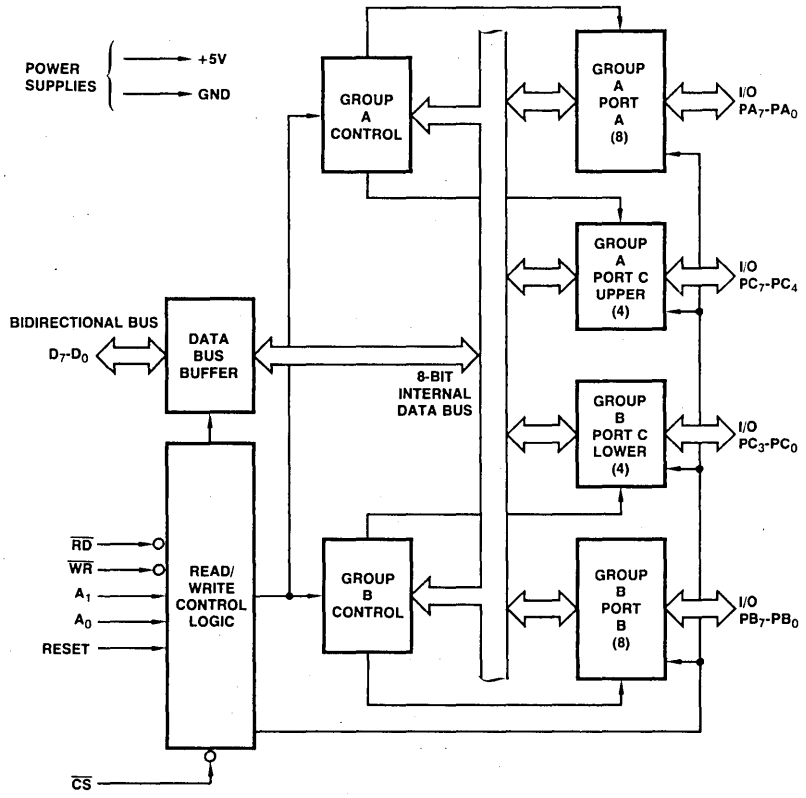
© IC MASTER 1983

Am8255A Programmable Peripheral Interface (PPI)

The Am8255A programmable peripheral interface functions as a general-purpose I/O component to interface peripheral equipment to the microcomputer data bus in Am8080A/Am9080A and Am8085A microprocessor systems. The functional configuration of the Am8255A is programmed by the system software so that generally no external logic is necessary.

The PPI has 24 I/O pins which may be individually programmed in two groups of 12 and used in three major modes of operation. In the first mode, each group of I/O pins may be programmed in sets of four and eight to be inputs or outputs. In the second mode, each group may be programmed to have eight input or output lines. Three of the remaining four pins are used for handshaking and interrupt control signals. The third mode is the bidirectional bus mode; it uses eight lines for a bidirectional data bus and five lines, borrowing one from the other group, for handshaking.

The Am8255A is available in two speed versions, requires a single 5V supply and is packaged in either a plastic or hermetic 40-pin DIP.



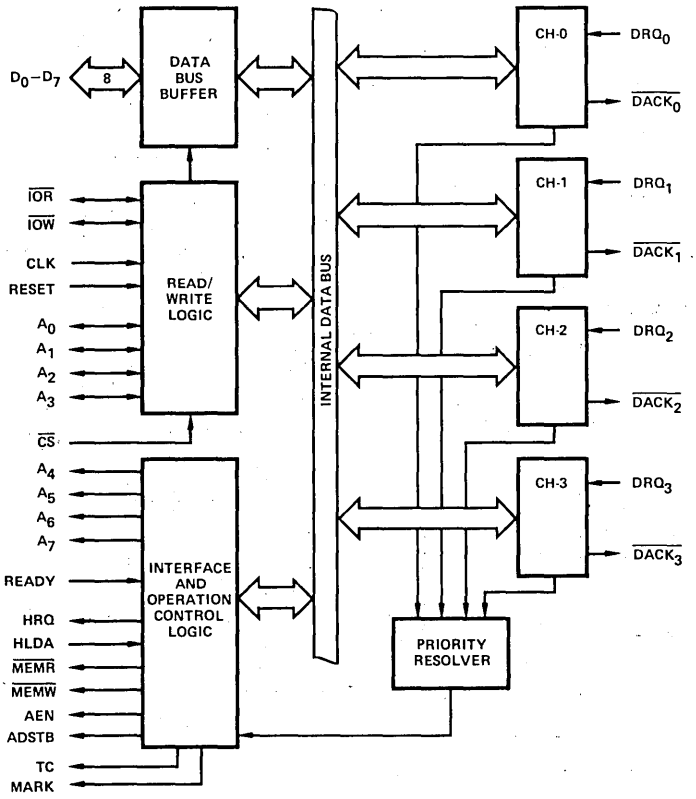
© IC MASTER 1983

Am8257/Am9557 Direct Memory Access (DMA) Controller

The Am8257/Am9557 is a 4-channel direct memory access controller which permits the high-speed transfer of data directly between peripherals and memory in microcomputer systems.

When peripheral requests are received, the Am8257/Am9557 issues a HOLD signal to the host CPU, assumes control of the system busses, selects the highest priority peripheral for servicing, and generates the necessary control signals and memory address required for the data transfer. It maintains a byte count for each channel and issues a terminal count signal upon completion of the programmed number of transfers.

The Am8257/Am9557 requires a single, 5V supply and is available in either a plastic or hermetic 40-pin DIP. For improved functional and performance characteristics, see the Am9517A Multimode DMA controller.



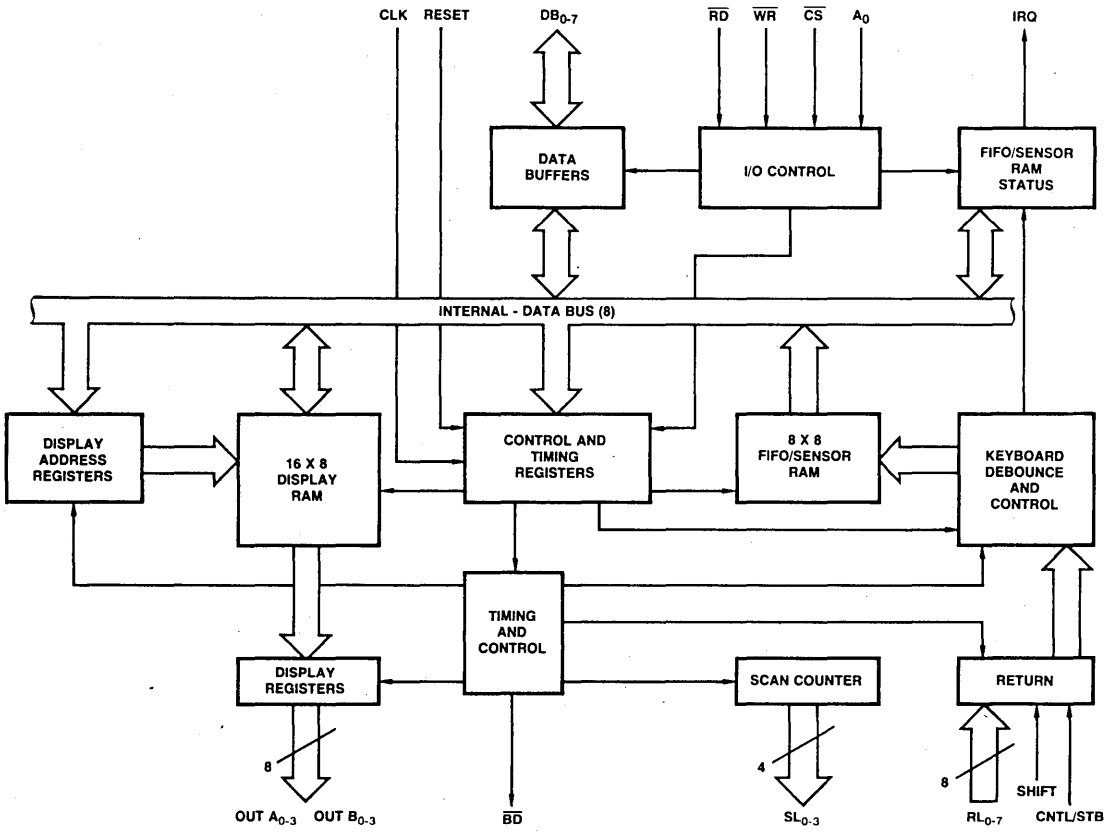
© IC MASTER 1983

Am8279 Keyboard/Display

The Am8279 programmable keyboard/display I/O interface controls data input and display functions in microprocessor systems. It connects directly to the microcomputer data bus and all operating modes are CPU programmable.

The Am8279 has two sections: keyboard and display. The keyboard portion can provide a scanned interface to a 64-contact key matrix, a sensor array or a strobed interface keyboard. Key depressions can be 2-key lockout or N-key rollover. Keyboard entries are debounced and strobed in an 8-character FIFO. The display portion contains a 16 x 8 Display RAM which can be organized into dual 16 x 4. It provides a scanned display interface for LED, incandescent and other popular display technologies. Both right-entry calculator and left-entry typewriter display formats are possible.

Available in two speed versions, the Am8279 requires a single, 5V supply and is packaged in either a plastic or hermetic 40-pin DIP.



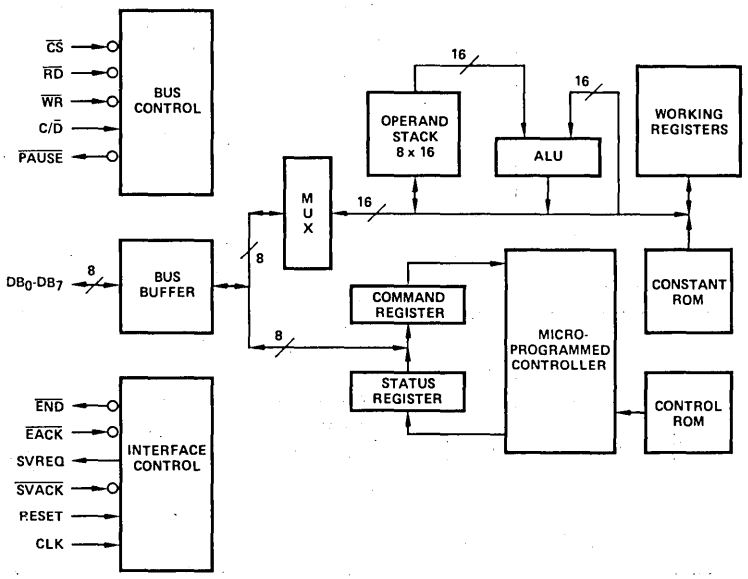
© IC MASTER 1983

Am9511A Arithmetic Processing Unit (APU)

The Am9511A arithmetic processing unit is used to enhance the computational capability of a wide variety of 8-bit microprocessor systems. It provides high performance 16 and 32-bit fixed-point and 32-bit floating-point arithmetic operations, performs trigonometric and inverse trigonometric functions, and executes a variety of mathematical operations such as square root, logarithm and exponentiation.

Data are transferred to and from the APU via a CPU by using conventional programmed I/O, or by a direct memory access device if higher transfer speeds are required. All transfers, including operand, result, status and command information, take place over an 8-bit bidirectional data bus. Operands are pushed onto an internal stack and a command is issued to perform operations on the data in the stack. Results are then available to be retrieved from the stack or additional commands may be entered. Upon completion of each command, the APU issues an end of execution signal; this signal may be used as an interrupt by the CPU to help coordinate program execution.

The Am9511A is available with a 2MHz, 3MHz or 4MHz maximum clock frequency in a hermetic 24-pin DIP.



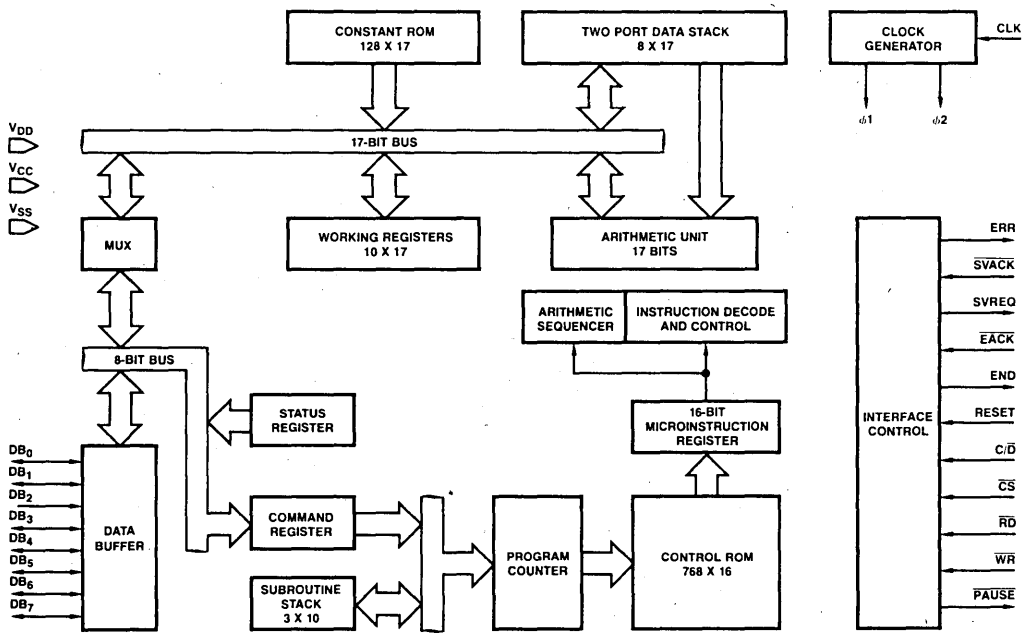
© IC MASTER 1983

Am9512 Floating-Point Processing Unit (FPU)

The Am9512 floating-point processing unit enhances the computational capability of the CPU in 8-bit microprocessor systems. It provides single precision (32-bit) and double precision (64-bit) add, subtract, multiply and divide operations.

Data are transferred between the Am9512 and the CPU by using programmed I/O or direct memory access techniques. The operand, result, status and command information transfers occur over an 8-bit bidirectional data bus. Operands are pushed onto an internal stack by the CPU and a command is issued to perform an operation on the data stack. The results of this operation are available to the CPU by popping the stack. Upon completion of an operation, the Am9512 issues an end of execution signal; this signal can be used to interrupt the CPU.

The FPU is available in two speed versions and is packaged in a hermetic 24-pin DIP.



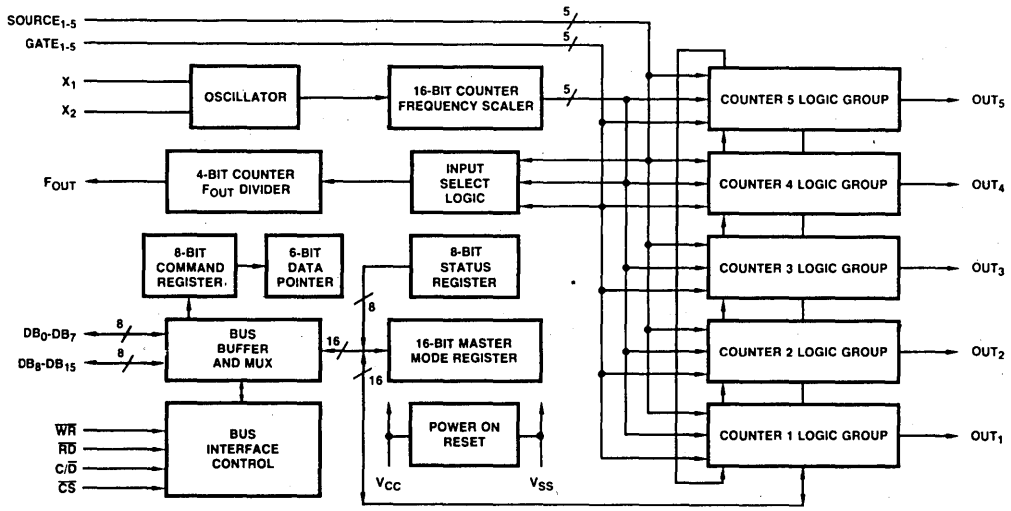
© IC MASTER 1983

Am9513 System Timing Controller (STC)

The Am9513 system timing controller performs many types of counting, sequencing and timing operations in 8-bit or 16-bit microprocessor systems. It provides the capability for programmable frequency synthesis, high-resolution programmable duty-cycle waveforms, retriggerable digital timing functions, time-of-day clocking, coincidence alarms, complex pulse generation, high-resolution baud-rate generation, frequency shift keying, stopwatch timing, event-count accumulation, waveform analysis and many more. A variety of programmable operating modes and control features allows the Am9513 to be personalized for specific applications as well as dynamically reconfigured under program control.

The STC includes five general-purpose 16-bit counters. A variety of internal frequency sources and external pins may be selected as inputs for individual counters with software selectable active-HIGH or active-LOW input polarity. Both hardware and software gating of each counter are available. Three-state outputs for each counter provide pulses or levels and can be active-HIGH or active-LOW. The counters can be programmed to count up or down in either binary or BCD. The CPU may read an accumulated count at any time without disturbing the counting process. Any of the counters my be internally concatenated to form an effective counter length of up to 80 bits.

The Am9513 requires a single, 5V supply and is available in either a plastic or hermetic 40-pin DIP.



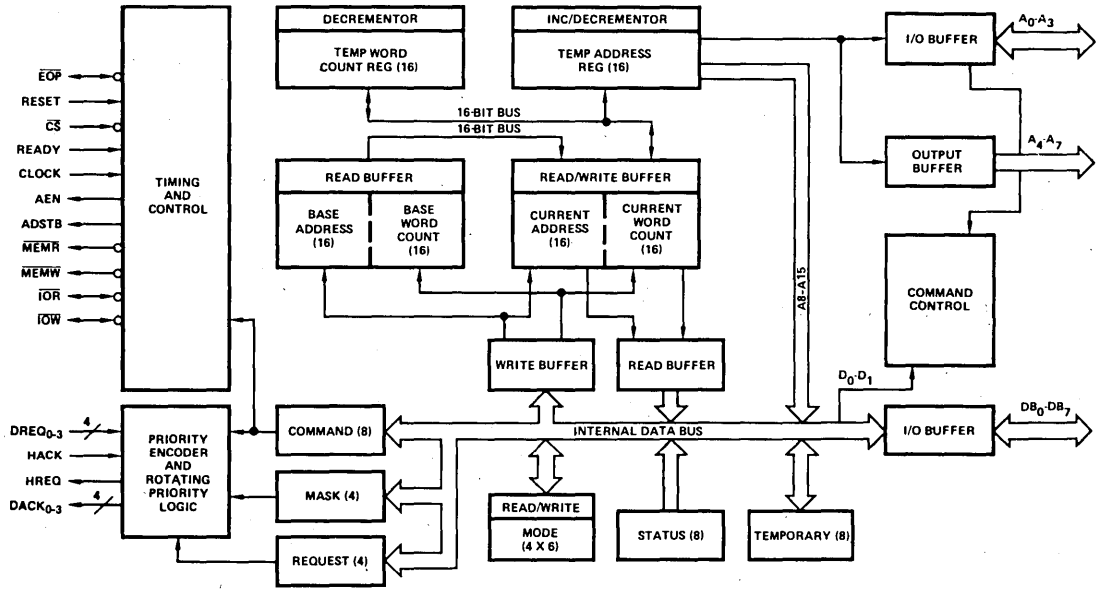
© IC MASTER 1983

Am9517A Direct Memory Access (DMA) Controller

The Am9517A multimode direct memory access controller improves microprocessor system performance by allowing external devices to directly transfer information to or from the system memory or from memory to memory. It offers a wide variety of programmable control features to enhance data throughput and allow dynamic reconfiguration under program control.

The Am9517A contains four independent DMA channels and can be expanded to any number of channels by cascading additional controller chips. Each channel has 64K address and word count capability and can be individually programmed to autoinitialize to its original condition following an End of Process (EOP). Each of the three active transfer modes – Single Word, Block and Demand – can perform Read, Write and Verify transfers. A memory-to-memory option is provided in addition to the standard memory-peripheral DMA transfer capability.

The DMA controller requires a single, 5V supply and is available in either a plastic or hermetic 40-pin DIP.



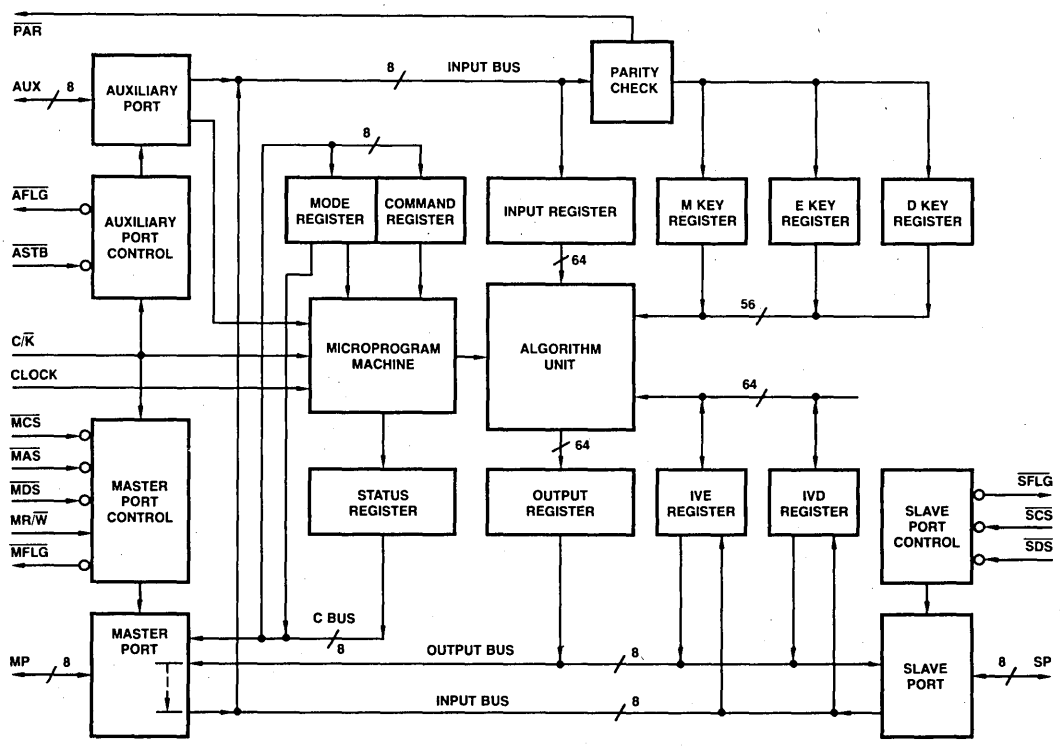
© IC MASTER 1983

Am9518 Data Ciphering Processor (DCP)

The Am9518 data ciphering processor encrypts and decrypts data using the National Bureau of Standards encryption algorithm. It can be used in a variety of environments including dedicated controllers, communication concentrators, terminals and peripheral task processors in general microprocessor systems. The DCP provides throughput rates greater than one megabyte per second using the Cipher Feedback, Electronic Code Book or Chain Block Cipher operating modes. Separate ports are provided for key input, clear data and enciphered data to enhance security.

The Am9518 can be used in 8 or 16-bit microprocessor systems with the CPU programming the DCP through the master port. The DCP can also be configured to accept control information on dedicated control lines, allowing it to be used in 2900 based bit-slice designs, with the control information derived directly from microcode memory. In either configuration, once set up data can flow through the DCP at high rates because input, output and ciphering activities are performed concurrently. Control lines are provided for interfacing to external DMA devices.

The Am9518 requires a single, 5V supply and is available in either a plastic or hermetic 40-pin DIP.



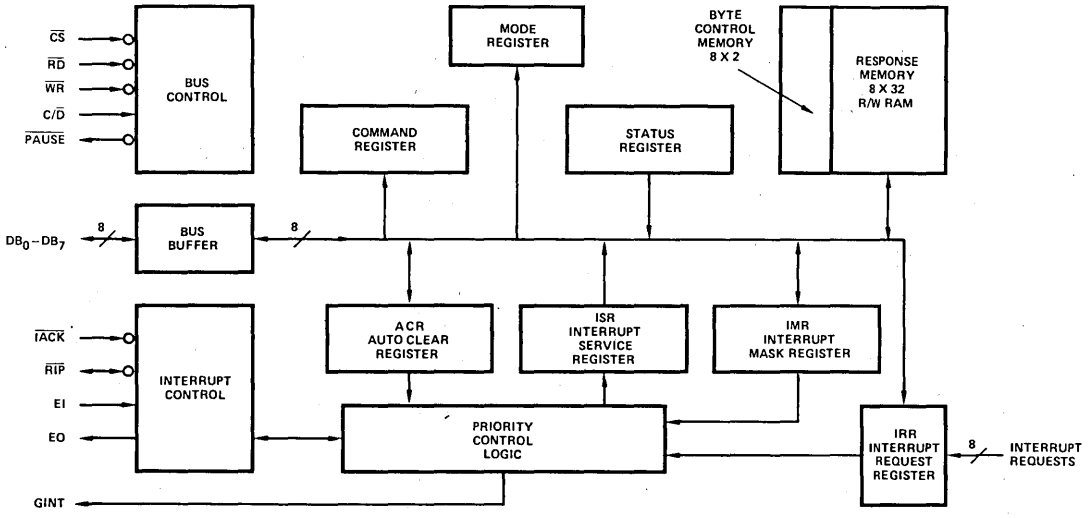
© IC MASTER 1983

Am9519A Interrupt Controller

The Am9519A universal interrupt controller provides a powerful interrupt structure to increase the efficiency and versatility of microcomputer systems. It contains, on one chip, all of the circuitry necessary to detect, prioritize and manage eight vectored interrupts. Its simple expansion structure allows many units to be cascaded for the control of large numbers of interrupts.

When the Am9519A receives an unmasked Interrupt Request, it issues a Group Interrupt output to the CPU. When the interrupt is acknowledged, the controller outputs the one-to-four byte response associated with the highest priority unmasked interrupt request. Since the response bytes are fully programmable, any instruction or vectoring protocol appropriate for the CPU may be used. The ability of the CPU to set interrupt requests under software control permits hardware prioritization of software tasks and aids system diagnostic and maintenance procedures.

The Am9519A requires a single, 5V supply and is available in either a plastic or hermetic 28-pin DIP.



© IC MASTER 1983

Am9520 Burst Error Processor (BEP)

The Am9520 burst error processor provides a tool for implementing the most common error detection and correction schemes in microprocessor-based digital data-handling systems. Because modern disks use high data recording densities, the probability of errors occuring during data recovery is increased. Burst error detection and correction schemes based on Fire codes are used to correct such errors and to enhance the overall disk system performance.

The Am9520 provides four standard polynomials, including the popular 56-bit and 48-bit versions; logic levels on two inputs select the desired polynomial. For encoding, the data stream is divided by a selected polynomial using rules of algebra in polynomial fields. This division results in a remainder which is appended to the data as check bits. For error checking, the bit stream containing both data and check bits is divided by the same selected polynomial. If there are no detectable errors, this division results in a zero remainder. If an error is detected, the Am9520 will extract the burst error pattern and the location of the burst in the data stream.

The Am9520 requires a single-phase clock and a 5V supply. It is packaged in either a plastic or hermetic 40-pin DIP.

AMERICAN MICROSYSTEMS, INC.

S6809/S68A09/S68B09

8-BIT MICROPROCESSING UNIT

Features

- ☐ Interfaces With All S6800 Peripherals
- ☐ Upward Compatible Instruction Set and Addressing Modes
- ☐ Upward Source Compatible Instruction Set and Addressing Modes
- ☐ Two 8-Bit Accumulators Can Be Concatenated Into One 16-Bit Accumulator
- ☐ On-Chip Crystal Oscillator (4 times XTAL)

General Description

The S6809 is an advanced processor within the S6800 family offering greater throughput, improved byte efficiency, and increased adaptability to various software disciplines. These include position independence, reentrancy, recursion, block structuring, and high level language generation.

Because the S6809 generates *position-independent* code, software can be written in modular form for easy user expansion as system requirements increase. The S6809 is hardware compatible with all S6800 peripherals, and any assembly language code prepared for the S6800 can be passed through the S6809 assembler to produce code which will run on the S6809.

AMI

AMERICAN MICROSYSTEMS, INC.

S6805

MICROCOMPUTER

Features

☐ **Hardware**
- 8-Bit Architecture
- 64 Bytes RAM
- 1100 Bytes ROM
- 116 Bytes of Self Check ROM
- 28 Pin Package
- Memory Mapped I/O
- Internal 8-Bit Timer with 7-Bit Prescaler
- Vectored Interrupts — External, Timer, Software, Reset
- 20 TTL/CMOS Compatible I/O Line 8 Lines LED Compatible
- On-Chip Clock Circuit
- Self-Check Capability
- Low Voltage Inhibit
- 5 Vdc Single Supply

☐ **Software**
- Similar to 6800
- Byte Efficient Instruction Set
- Versatile Interrupt Handling
- True Bit Manipulation
- Bit Test and Branch Instruction
- Indexed Addressing for Tables
- Memory Usable as Registers/Flags
- 10 Addressing Modes
- Powerful Instruction Set
  - — All 6800 Arithmetic Instructions
  - — All 6800 Logical Instructions
  - — All 6800 Shift Instructions
  - — Single Instruction Memory Examine/Change
  - — Full Set of Conditional Branches

S6551/S68051

ASYNCHRONOUS COMMUNICATION INTERFACE ADAPTER

Features

- ☐ On-Chip Baud Rate Generator: 15 Programmable Baud Rates Derived from a Standard 1.8432MHz External Crystal (50 to 19,200 Baud)
- ☐ Programmable Interrupt and Status Register to Simplify Software Design
- ☐ Single +5 Volt Power Supply
- ☐ Serial Echo Mode
- ☐ False Start Bit Detection
- ☐ 8-Bit Bi-Directional Data Bus for Direct Communication With the Microprocessor
- ☐ External 16× Clock Input for Non-Standard Baud Rates (Up to 125K Baud)
- ☐ Programmable: Word Lengths; Number of Stop Bits; and Parity Bit Generation and Detection
- ☐ Data Set and Modem Control Signals Provided
- ☐ Parity: (Odd, Even, None, Mark, Space)
- ☐ Full-Duplex or Half-Duplex Operation
- ☐ 5, 6, 7, 8 and 9-Bit Transmission

General Description

The S6551/S68051 is an Asynchronous Communication Adapter (ACIA) intended to provide for interfacing the 6500/6800 microprocessor families to serial communication data sets and modems. A unique feature is the inclusion of an on-chip programmable baud rate generator, with a crystal being the only external component required.

S68045/S68A045/S68B045

CRT CONTROLLER (CRTC)

Features

- ☐ Generates Refresh Addresses and Row Selects
- ☐ Generates Video Monitor Inputs: Horizontal and Vertical Sync and Display Enable
- ☐ Low Cost; MC6845/SY6545 Pin Compatible
- ☐ Text Can Be Scrolled on a Character, Line or Page Basis
- ☐ Addresses 16K Bytes of Memory
- ☐ Screen Can Be Up to 128 Characters Tall By 256 Wide
- ☐ Character Font Can Be 32 Lines High With Any Width
- ☐ Two Complete ROM Programs
- ☐ Cursor and/or Display Can Be Delayed 0, 1 or 2 Clock Cycles
- ☐ Four Cursor Modes:
  - Non-Blink
  - Slow Blink
  - Fast Blink
  - Reverse Video With Addition of a Single TTL Gate
- ☐ Three Interlace Modes
  - Normal Sync
  - Interlace Sync
  - Interlace Sync and Video
- ☐ Full Hardware Scrolling
- ☐ NMOS Silicon Gate Technology
- ☐ TTL-Compatible, Single +5 Volt Supply

AMU/PR

CMOS 16-BIT MICROPROCESSOR

Features

- ☐ CMOS Silicon-Gate Technology
- ☐ 16-Bit Instruction Word
- ☐ Full Minicomputer Instruction Set Capability Including Multiply and Divide
- ☐ Up to 64K Bytes of Addressable Memory
- ☐ 8-Bit Memory Data Bus
- ☐ Advanced Memory-to-Memory Architecture
- ☐ Separate Memory, I/O, and Interrupt-Bus Structures
- ☐ 16 General Registers
- ☐ 5 Prioritized Interrupts
- ☐ Programmed and DMA I/O Capability
- ☐ On-Chip Clock Generator
- ☐ Single 5V Supply
- ☐ 16 General Purpose Flags
- ☐ Power Down State (IDLE)
- ☐ Compatible With All S9900 Peripherals
- ☐ 48-Pin Package

General Description

The AMU/PR is a single-chip 16-bit central processing unit (CPU) produced using an advanced dual-poly CMOS silicon-gate technology. The instruction set includes capabilities offered by full minicomputers and is 9940 compatible. The unique memory-to-memory architecture features multiple register files (resident in memory) which allow faster response to interrupts and increase programming flexibility. The separate bus structure simplifies the system design. AMI provides a compatible set of CMOS memory and support circuits to be used with the AMU/PR system. The AMU Family system is fully supported by software and hardware development systems. The AMU/PR is the prototyping chip for the AMI Alterable Microcomputer Family.

FAIRCHILD
A Schlumberger Company

F8 • F3870 • F6800 • F16000
Fairchild Microprocessors

Fairchild microcomputers cover the spectrum from 8-bit MOS to 16-bit bipolar microprocessors:

- **1-chip F387X microcomputer multi-chip F8 family with software and compatibility.**
- **2-chip F6802/6846 combination plus a powerful bus-oriented F6800 family well-supported by a large variety of peripheral devices.**
- **16-bit F9445 bipolar microprocessor.**
- **16-bit F16000 microprocessor family with 32-bit architecture.**
- **I^3L® logic family.**

These products are supported by training courses for the design engineer who must learn to design the microprocessor into a working system and those designers who need to complement their hardware capabilities with software experience or those software types who must gain an intimate knowledge of the hardware. All courses emphasize lots of hands-on time backed by examples to enhance students' working familiarity with each microprocessor.

Courses are offered at Santa Clara, California, or on-site courses may be arranged with a local Fairchild sales office or distributor.

HOW TO ENROLL—Call or write the Microprocessor Division at (408) 773-1000; 3420 Central Expressway, Santa Clara, CA 95051.

FAIRCHILD F3870—The 8-bit single-chip F3870 microcomputer is ideal for high-volume, low-cost applications, featuring a single +5 V power supply, 2048 bytes of ROM, 64 bytes of scratchpad RAM, 32 bits of I/O, and a programmable timer and interrupt.

FAIRCHILD F6800—The 8-bit MOS F6800 family offers a complete and continuously expanding range of microprocessor devices with a powerful instruction set. On the low end there is the F6802/6846 2-chip combination that features a processor chip combination with 128 bytes of on-board RAM, of which 32 bytes have a power-down feature.

The F6800 family is supported by a large array of peripheral devices, which include: ROM, RAM, EPROM, synchronous and asynchronous controller for data communications, timers, direct memory access (DMA), CRT controller, and the F68488 for the IEEE Standard Bus Controller.

FAIRCHILD F9445—The 16-bit F9445 is particularly well-suited to use in high-performance microprocessor systems. Implemented using Fairchild's I^3L bipolar technology and a sophisticated pipeline architecture, it offers very fast execution times, and operates at full speed over the military temperature and voltage ranges.

FAIRCHILD F16000—The 16-bit F16000 family, the CPU of which has a 32-bit internal structure, is designed to significantly reduce software costs while improving software quality.

FAIRCHILD I^3L LOGIC FAMILY—The F9414 four-chip data encryption set implements the data encryption standard (DES) algorithm (FIPS-46) with a data throughput of 75 ns per bit.

F3870
Single-Chip Microcomputer

Microprocessor Product

Description

The Fairchild single-chip microcomputer series offers a variety of circuits to serve the high-volume, cost-sensitive controller market. The F3870 is a complete 8-bit microcomputer on a single MOS integrated circuit. The F3870 can execute the F8 instruction set of more than 70 commands, allowing expansion into multi-chip configurations with software compatibility. The device features 64 bytes of scratchpad RAM, a programmable binary timer, 32 bits of I/O, a single +5 V power supply requirement, and a choice of 1K, 2K, 3K, or 4K of ROM.

Utilizing Fairchild's double-ion-implanted, N-channel silicon-gate technology and advanced circuit design techniques, the single-chip F3870 offers maximum cost effectiveness in a wide range of control and logic replacement applications.

- **Single-Chip Microcomputer**
- **Software-Compatible with F8 Family**
- **1024-, 2048-, 3072-, or 4096-Byte Programmable ROM**
- **64-Byte Scratchpad RAM**
- **32-Bit (4-Port) TTL-Compatible I/O**
- **Programmable Binary Timer:**
  - **Interval Timer Mode**
  - **Pulse Width Measurement Mode**
  - **Event Counter Mode**
- **External Interrupt**
- **Crystal, LC, RC, or External Time Base**
- **Low Power (275 mW, Typical)**
- **Single +5 V ± 10% Power Supply**

Signal Functions

The functions of the F3870 inputs and outputs are described in *Table 1.*

Connection Diagram

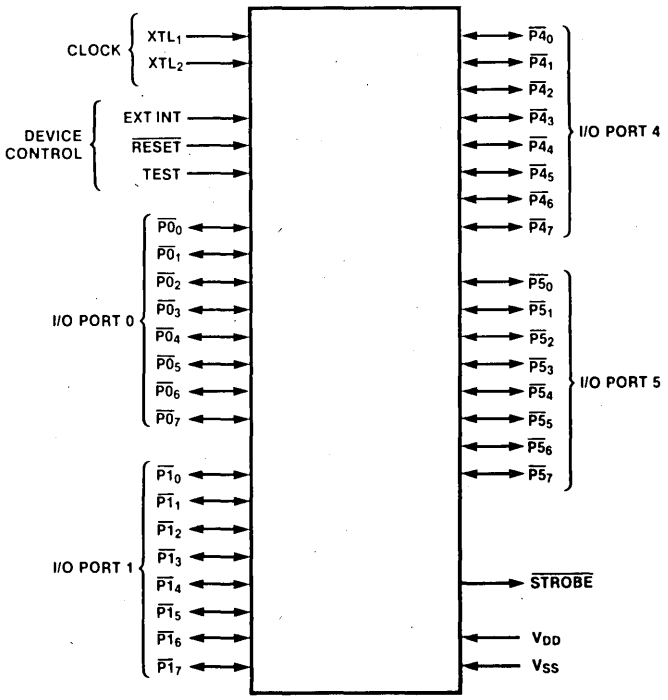
Signal Functions



F3870 Architecture

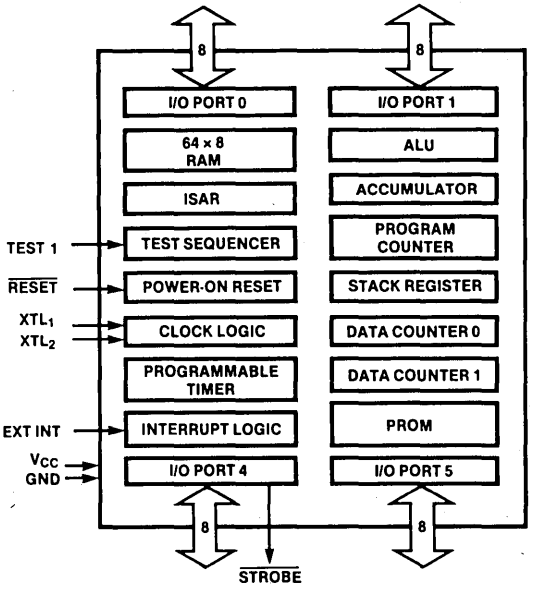


Table 1 Signal Functions

Mnemonic	Pin No.	Name	Description
Device Control			
EXT INT	38	External Interrupt	Software-programmable input that is also used in conjunction with the timer for pulse width measurement and event counting.
$\overline{\text{RESET}}$	39	External Reset	Input that may be used to externally reset the F3870. When pulled low, the F3870 resets; when then allowed to go high, the F3870 begins program execution at program location H'0000'.
TEST	21	Test Line	An input used only in testing the F3870. For normal circuit operation, TEST is left unconnected or grounded.
Clock			
$\overline{\text{STROBE}}$	7	Ready Strobe	Normally high output that provides a single low pulse after valid data is present on the $\overline{P4_0}$-$\overline{P4_7}$ pins during an output instruction.
XTL_1, XTL_2	1, 2	Time Base	Inputs to which a crystal (1 MHz to 4 MHz), LC network, RC network, or external single-phase clock may be connected.
I/O Ports			
$\overline{P0_0}$-$\overline{P0_7}$ $\overline{P1_0}$-$\overline{P1_7}$ $\overline{P4_0}$-$\overline{P4_7}$ $\overline{P5_5}$-$\overline{P5_7}$	3-6, 8-19, 22-37	I/O Ports	Thirty-two bidirectional lines that can be individually used as either TTL-compatible inputs or latched outputs.
Power			
V_{DD}	40	Power Input	+5 V ± 10% power supply
V_{SS}	20	Ground	Signal and power ground

F38C70 Single-Chip Microcomputer

Microprocessor Product

Description

The Fairchild F38C70 8-bit single-chip microcomputer is a member of the F387X series; it executes all of the F8 instruction set and is software-compatible with the F3870. Additional power-save instructions provide two different power-save modes.

Implemented in ion-implanted CMOS doublepoly silicon-gate technology, the F38C70 offers maximum cost effectiveness in a wide range of applications requiring very low power consumption.

More than 70 commands of the F8 instruction set are executed by the single-chip microcomputer, which features 2048 bytes of ROM, 64 bytes of scratchpad RAM, a programmable timer, 32 bits of I/O, and a single +5 V power supply.

- **Single CMOS Integrated Circuit**
- **Software-Compatible with F8 and F3870**
- **2048-Byte Mask Programmable ROM**
- **64-Byte Scratchpad RAM**
- **32-Bit I/O with Four Options**
- **8-Bit Programmable Timer with 16-Bit Programmable Prescaler**
- **External Interrupt**
- **Crystal, LC, RC, or External Clock**
- **Single +5 V (±10%) Power Supply**
- **Power-Save (PS) and Power-Save All (PSA) Modes**
- **Option for all Short Machine Cycles**
- **Direct Replacement for F3870**
- **Low Power (50 mW typ., 5 mW in PS mode, 0.5 mW in PSA mode)**

F38E70
Single-Chip Microcomputer

Microprocessor Product

Description

The Fairchild single-chip microcomputer series offers a variety of circuits for the high-volume, cost-sensitive markets. The F38E70 is a complete 8-bit microcomputer on a single MOS integrated circuit. The F38E70 is functionally identical to the F3870, except the F38E70 has 2K bytes of EPROM in place of 2K bytes of ROM. The F38E70 can execute the F8 instruction set of more than 70 commands. The device features 2048 bytes of EPROM, 64 bytes of scratchpad RAM, a programmable binary timer, 32 bits of I/O, and a single +5 V power supply requirement.

Utilizing Fairchild's double-ion-implant, N-channel technology and advanced circuit design techniques, the single-chip F38E70 offers maximum cost-effectiveness in many low-to-medium volume systems. When production volume requires large quantities, the transition to the mask-programmed F3870 is very straightforward, with no circuit design changes.

- **Single-Chip Microcomputer**
- **Software-Compatible with F8 Family**
- **2048-Byte EPROM (F38E70-2)**
- **64-Byte Scratchpad RAM**
- **32-Bit (4-Port) TTL-Compatible I/O**
- **Programmable Binary Timer**
  - **Interval Timer Mode**
  - **Pulse Width Measurement Mode**
  - **Event Counter Mode**

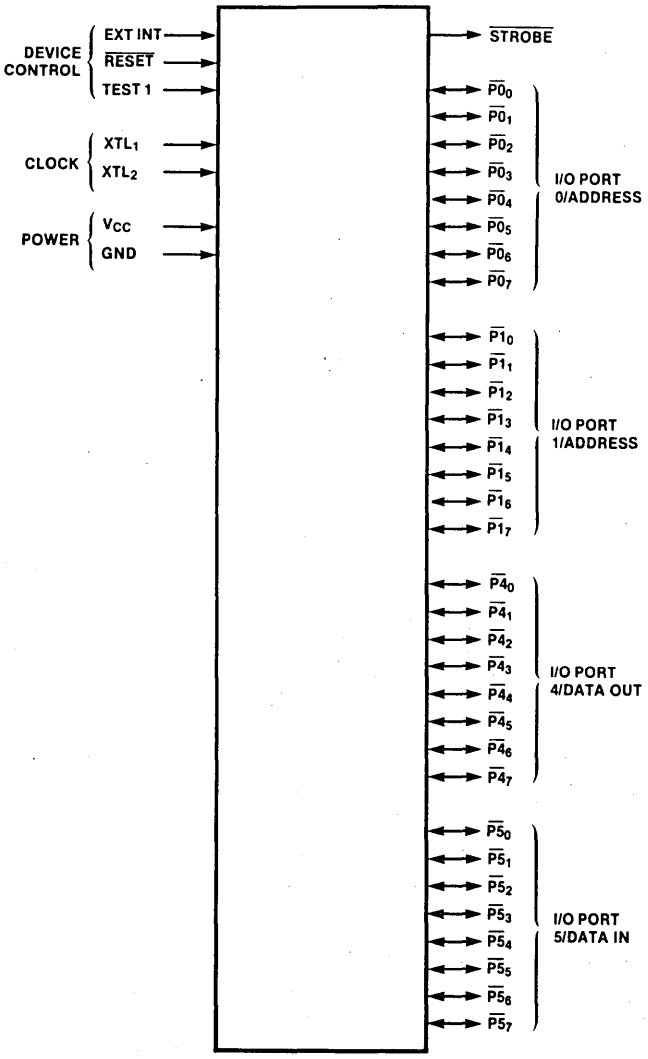
Signal Functions



Device Organization

This section describes the basic functional elements of the F38E70 as shown in *Figure 1*.

Main Control Logic
The instruction register (IR) receives the operation code (OP code) of the instruction to be executed from the program EPROM via the data bus. During all OP code fetches, eight bits are latched into the IR. Some instructions are completely specified by the upper four bits of the OP code. In those instructions, the lower four bits are an immediate register address or an immediate 4-bit operand. Once latched into the IR, the main control logic decodes the instruction and provides the necessary control gating signals to all circuit elements.

EPROM Address Registers
There are four 11-bit registers associated with the 2K x 8 EPROM. These are the program counter (P0), the stack register (P), the data counter (DC), and the auxiliary data counter (DC1). The program counter is used to address instructions or immediate operands. The stack register is used to save the contents of P0 during an interrupt or subroutine cell. Thus, P contains the return address at which processing is to resume upon completion of the subroutine or the interrupt routine.

The data counter (DC) is used to address data tables. This register is auto-incrementing. Of the two data counters, only DC can access the EPROM. However, the XDC instruction allows DC and DC1 to be exchanged.

Associated with the address registers is an 11-bit adder/incrementer. This logic element is used to increment P0 or DC when required, and is also used to add displacements to P0 on relative branches or to add the accumulator contents to DC1 with the ADC (add data counter) instruction.

2048 x 8 EPROM
The microcomputer program and data constants are stored in the program EPROM. When an EPROM access is required, the appropriate address register (P0 or DC) is gated onto the EPROM address bus and the EPROM output is gated onto the main data bus. The first byte in the EPROM is location zero.

Scratchpad and ISAR
The scratchpad provides 64 8-bit registers that may be used as general-purpose read/write data memory. The indirect scratchpad address register (ISAR) is a 6-bit register used to address the 64 registers. All 64 registers may be accessed using ISAR. In addition, the lower order 12 registers may also be directly addressed.

The ISAR can be visualized as holding two octal digits. This division of ISAR is important, since a number of instructions increment or decrement only the least significant three bits of ISAR when referencing scratchpad bytes via ISAR. This makes it easy to reference a buffer consisting of up to eight contiguous scratchpad bytes. For example, when the low-order octal digit is incremented or decremented, ISAR is incremented from 27_8 to 20_8 or is decremented from 20_8 to 27_8. This feature of the ISAR is very useful in many

Pin Functions

Pin Name	Type	Description
$\overline{P0}_0$-$\overline{P0}_7$ $\overline{P1}_0$-$\overline{P1}_7$ $\overline{P4}_0$-$\overline{P4}_7$ $\overline{P5}_0$-$\overline{P5}_7$	Input/Output	Thirty-two lines that can be individually used as either TTL-compatible inputs or as latched outputs. For EPROM programming, 11 lines of ports 0 and 1 are used as address inputs and one line of port 1 is a program control. Port 5 is EPROM data input, and port 4 is EPROM output for verification.
$\overline{STROBE}$	Output	This pin, which is normally HIGH, provides a single LOW pulse after valid data is present on the $\overline{P4}_0$-$\overline{P4}_7$ pins during an output instruction.
$\overline{RESET}$	Input	$\overline{RESET}$ may be used to externally reset the F38E70. When pulled LOW, the F38E70 resets. When then allowed to go HIGH, the F38E70 begins program execution at the program location H '0000'. RESET is held LOW during EPROM programming.
EXT INT	Input	The external interrupt input. Its active state is software-programmable. This input is also used in conjunction with the timer for pulse width measurement and event counting.
XTL_1, XTL_2	Input	The time base inputs to which a crystal (1 to 4 MHz), LC network, RC network, or an external single-phase clock may be connected. If timing is not critical, the F38E70 operates from its internal oscillator with no external components.
TEST 1/V_{PP}	Input	An input used only in testing and programming the F38E70. For normal circuit functionality, this pin is left unconnected or may be grounded. For EPROM programming, the test pin is connected to the programming voltage (typically 23 V).
$P1_7$/TEST 2	Input	I/O during normal operation; must be HIGH when in verify mode.
V_{CC}	Power	V_{CC} is the power supply input (+5 V ± 10%).

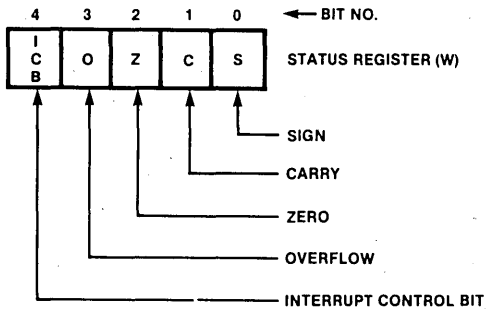
program sequences. All six bits of ISAR may be loaded at one time, or either half may be loaded independently.

Scratchpad registers 9 through 15 (decimal) are given mnemonic names (J, H, K, and Q) because of special linkages between these registers and other registers, such as a stack register. These special linkages facilitate the implementation of multi-level interrupts and subroutine nesting. For example, the instruction LR K, P stores the lower eight bits of the stack register into register 13 (K lower, or KL) and stores the upper three bits of P into the three least significant bits of register 12 (K upper, or KU).

Arithmetic and Logic Unit (ALU)
After receiving commands from the main control logic, the ALU performs the required arithmetic or logic operations (using the data presented on the two input busses) and provides the result on the result bus. The arithmetic operations that can be performed in the ALU are binary add, decimal adjust, add with carry, decrement, and increment. The logic operations that can be performed are AND, OR, exclusive-OR, ones complement, shift right, and shift left. Besides providing the result on the result bus, the ALU also provides four signals representing the status of the result. These signals, stored in the status register (W), represent the CARRY, OVERFLOW, SIGN, and ZERO condition of the result of the operation.

Accumulator
The accumulator (ACC) is the principal register for data manipulation within the F38E70. The ACC serves as one input to the ALU for arithmetic or logical operations. The results of ALU operations are stored back into the ACC.

Status Register
The status register (W) holds five status flags, as follows:



Summary of Status Bits

$$\text{OVERFLOW} = \text{CARRY}_7 \oplus \text{CARRY}_6$$

$$\text{ZERO} = \overline{ALU_7} \wedge \overline{ALU_6} \wedge \overline{ALU_5} \wedge \overline{ALU_4} \wedge \overline{ALU_3} \wedge \overline{ALU_2} \wedge \overline{ALU_1} \wedge \overline{ALU_0}$$

$$\text{CARRY} = \text{CARRY}_7$$

$$\text{SIGN} = \overline{ALU_7}$$

Interrupt Control Bit—The ICB may be used to allow or disallow interrupts in the F38E70. This bit is not the same as the two interrupt enable bits in the interrupt control port (ICP). If the ICB is set and the F38E70 interrupt logic communicates an interrupt request to the CPU section, the interrupt is acknowledged and processed upon completion of the first non-privileged instruction. If the ICB is cleared, an interrupt request is not acknowledged or processed until the ICB is set again.

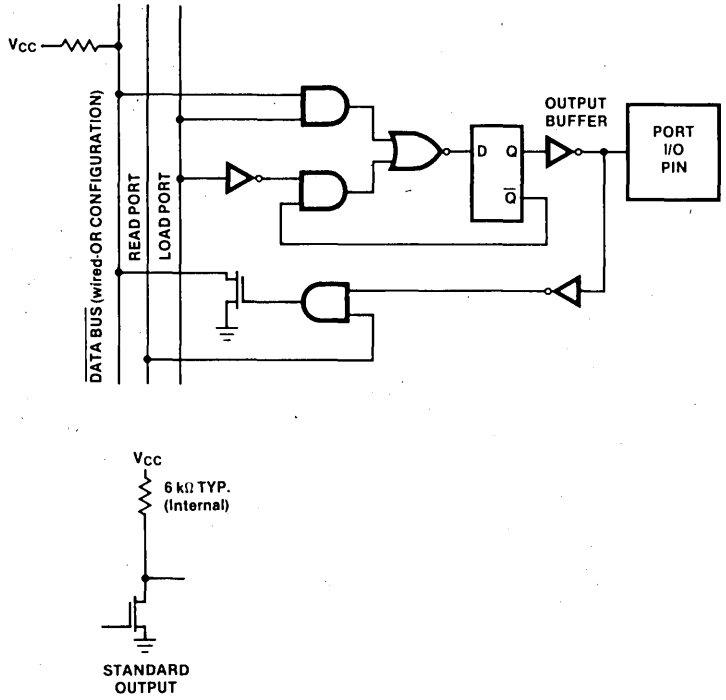
I/O Ports
The F38E70 provides four complete bidirectional input/output ports: these are ports 0, 1, 4, and 5. An output instruction (OUT or OUTS) causes the contents of the ACC to be latched into the addressed port. An input instruction (IN or INS) transfers the contents of the port to the ACC (port 6 is an exception, which is described later). The I/O buffers on the F38E70 are logically inverted. The schematic of an I/O port is shown in *Figure 2*.

An output ready strobe is associated with port 4. This flag may be used to signal a peripheral device that the F38E70 has just completed an output of new data to port 4. The strobe provides a single low pulse shortly after the output operation is completed, so either edge may be used to signal the peripheral. The $\overline{\text{STROBE}}$ signal may also be used to request new input information from a peripheral simply by doing a dummy output of H '00' to port 4 after completing the input operation.

Timer and Interrupt Control Port
The timer is an 8-bit binary down counter that is software-programmable to operate in one of three modes: the interval timer mode, the pulse width measurement mode, or the event counter mode (the timer characteristics are described in *Table 1*). As shown in *Figure 3*, associated with the timer are an 8-bit register called the interrupt control port, a programmable prescaler, and an 8-bit modulo-N register; *Figure 4* illustrates the timer/interrupt function.

© IC MASTER 1983

Fig. 2 I/O Port Diagram



All ports are standard output type only.

The $\overline{\text{STROBE}}$ output is always configured similar to a standard output, except that it is capable of driving three TTL loads.

Fig. 3 Timer and Interrupt Control Port Block Diagram

Table 1 Timer Characteristics

Definitions	
Error = indicated time value – actual time value	
tpsc = tϕ × prescale value	
Interval Timer Mode	
Single interval error, free-running (note 3)	± 6tϕ
Cumulative interval error, free-running (note 3)	0
Error between two timer reads (note 2)	± (tpsc + tϕ)
Start timer to stop timer error (notes 1, 4)	+ tϕ to – (tpsc + tϕ)
Start timer to read timer error (notes 1, 2)	– 5tϕ to – (tpsc + 7tϕ)
Start timer to interrupt request error (notes 1, 3)	– 2tϕ to – 8tϕ
Load timer to stop timer error (note 1)	+ tϕ to – (tpsc + 2tϕ)
Load timer to read timer error (notes 1, 2)	– 5tϕ to – (tpsc + 8tϕ)
Load timer to interrupt request error (notes 1, 3)	– 2tϕ to – 9tϕ
Pulse Width Measurement Mode	
Measurement accuracy (note 4)	+ tϕ to – (tpsc + 2tϕ)
Minimum pulse width of EXT INT pin	2tϕ
Event Counter Mode	
Minimum active time of EXT INT pin	2tϕ
Minimum inactive time of EXT INT pin	2tϕ

Notes
1. All times that entail loading, starting, or stopping the timer are referenced from the end of the last machine cycle of the OUT or OUTS instruction.
2. All times that entail reading the timer are referenced from the end of the last machine cycle of the IN or INS instruction.
3. All times that entail the generation of an interrupt request are referenced from the start of the machine cycle in which the appropriate interrupt request latch is set. Additional time may elapse if the interrupt request occurs during a privileged or multi-cycle instruction.
4. Error may be cumulative if operation is repetitively performed.

The desired timer mode, prescale value, starting and stopping the timer, active level of EXT INT pin, and local enabling or disabling of interrupts are selected by outputting the proper bit configuration from the accumulator to the interrupt control port (port 6) with an OUT or OUTS instruction. Bits within the interrupt control port are defined as follows:

Interrupt Control Port (Port 6)
Bit 0 — External Interrupt Enable
Bit 1 — Timer Interrupt Enable
Bit 2 — EXT INT Active Level
Bit 3 — Start/Stop Timer
Bit 4 — Pulse Width/Interval Timer
Bit 5 — ÷ 2 Timer Prescale Values
Bit 6 — ÷ 5 Timer Prescale Values
Bit 7 — ÷ 20 Timer Prescale Values

A special situation exists when reading the interrupt control port (with an IN or INS instruction). The accumulator is **not** loaded with the content of the ICP; instead, accumulator bits 0 through 6 are loaded with 0s, while bit 7 is loaded with the logic level being applied to the EXT INT pin, thus allowing the status of EXT INT to be determined without the necessity of servicing an external interrupt request. This capability is useful in establishing a high-speed polled handshake procedure or for using EXT INT as an extra input pin if external interrupts are not required and the timer is used only in the interval timer mode.

The rate at which the timer is clocked in the interval timer mode is determined by the frequency of an internal ϕ clock and by the division value selected for the prescaler. (The internal ϕ clock operates at one-half the external time base frequency.) If ICP bit 5 is set and bits 6 and 7 are cleared, the prescaler divides ϕ by two. Likewise, if bit 6 or 7 is individually set, the prescaler divides ϕ by 5 or 20, respectively. Combinations of bits 5, 6, and 7 may also be selected. For example, if bits 5 and 7 are set while 6 is cleared, the prescaler divides by 40. Thus, possible prescaler values are ÷ 2, ÷ 5, ÷ 10, ÷ 20, ÷ 40, ÷ 100, and ÷ 200.

Any of three conditions causes the prescaler to be reset: when the timer is stopped by clearing the ICP bit 3, on execution of an output instruction to port 7 (the timer is assigned port address 7), or on the trailing edge transition of the EXT INT pin when in the pulse width measurement mode. These last two conditions are explained in more detail below.

An OUT or OUTS instruction to port 7 loads the content of the accumulator to both the timer and the 8-bit modulo-N register, resets the prescaler, and clears any previously stored timer interrupt request. As previously noted, the timer is an 8-bit down counter that is clocked by the prescaler in the interval timer mode and in the pulse width measurement mode. The prescaler is not used in the event counter mode. The modulo-N register is a buffer whose function is to save the value that was most recently output to port 7. The modulo-N register is used in all three timer modes.

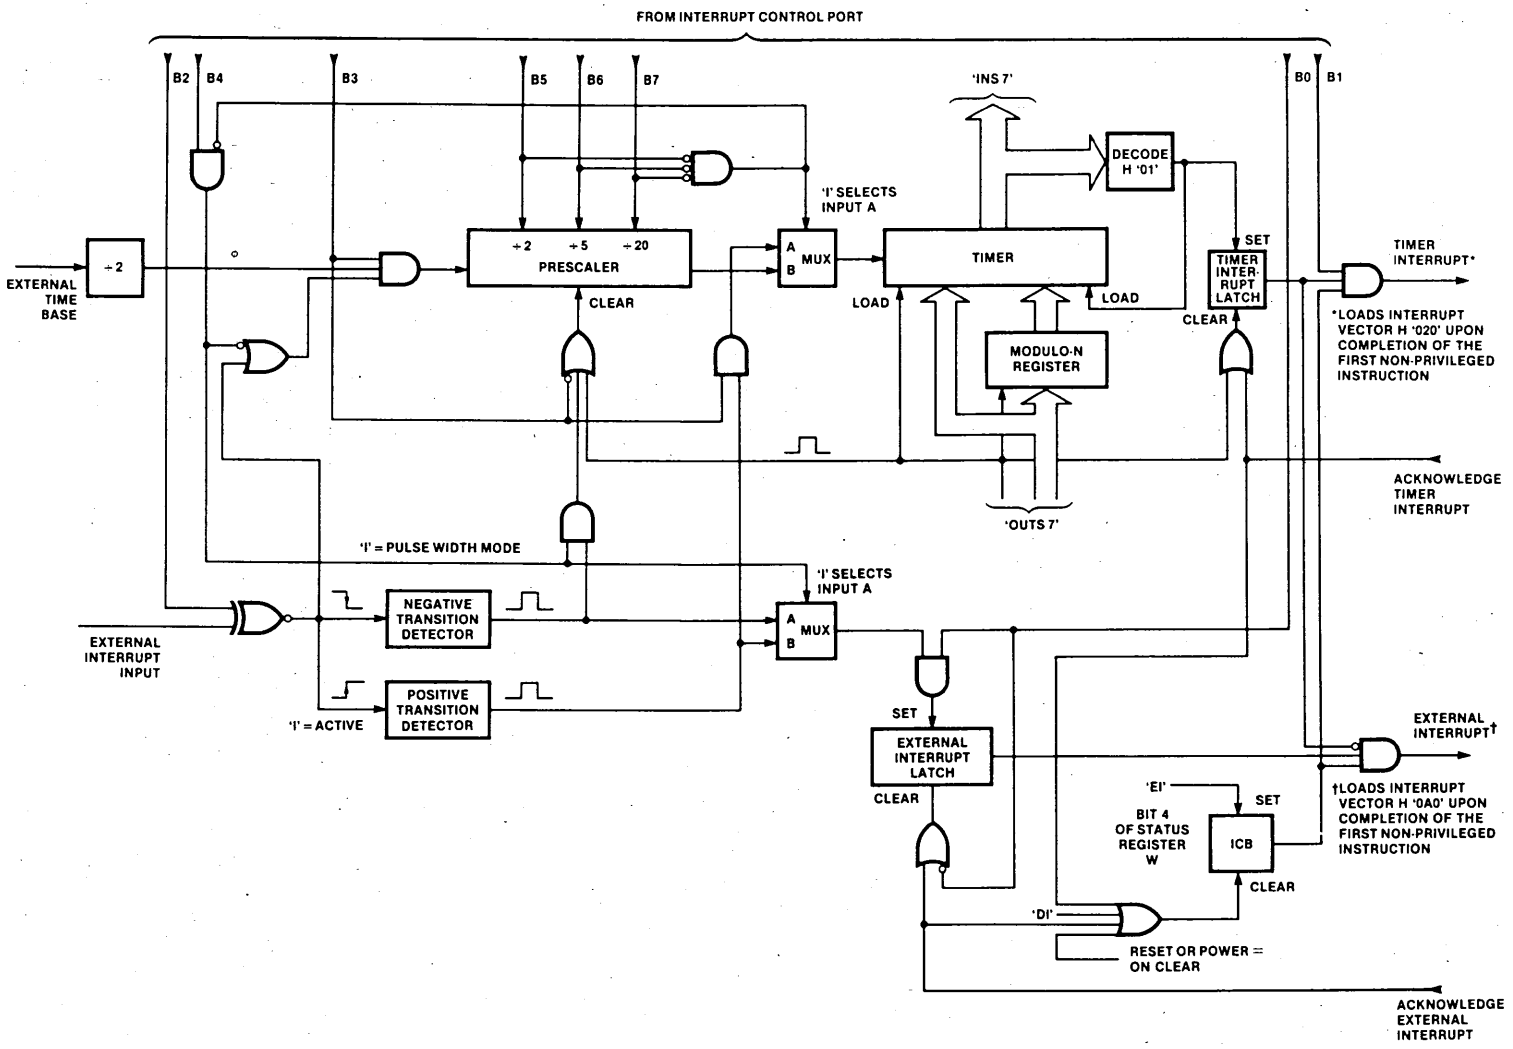
Fig. 4 Timer/Interrupt Functional Diagram



© IC MASTER 1983

Interval Timer Mode—When ICP bit 4 is cleared (logic 0) and at least one prescale bit is set, the timer operates in the interval timer mode. When bit 3 of the ICP is set, the timer starts counting down from the modulo-N value. After counting down to H '01', the timer returns to the modulo-N value at the next count. On the transition from H '01' to H 'N', the timer sets a timer interrupt request latch. Note that the interrupt request latch is set by the transition of H 'N' in the timer, thus allowing a full 256 counts if the modulo-N register is preset to H '00'. If bit 1 of the ICP is set, the interrupt request is passed on to the CPU section of the F38E70. However, if bit 1 of the ICP is a logic 0, the interrupt request is not passed on to the CPU section but the interrupt request latch remains set. If ICP bit 1 is subsequently set, the interrupt request is then passed on to the CPU section. (Recall from the discussion of the status register interrupt control bit that the interrupt request is acknowledged by the CPU section only if ICB is set.) Only two events can reset the timer interrupt request latch: when the timer interrupt request is acknowledged by the CPU section, or when a new load of the modulo-N register is performed.

Consider an example in which the modulo-N register is loaded with H '64' (decimal 100). The timer interrupt request latch is set at the 100th count following the timer start, and the timer interrupt request latch is repeatedly set on precise 100-count intervals. If the prescaler is set at ÷40, the timer interrupt request latch is set every 4000 ϕ clock periods. For a 2 MHz ϕ clock (4 MHz time base frequency), this produces 2 ms intervals.

The range of possible intervals is from 2 to 51,200 ϕ clock periods (1 μs to 25.6 ms for a 2 MHz ϕ clock). However, approximately 50 ϕ periods is a practical minimum because the time between setting the interrupt request latch and the execution of the first instruction of the interrupt service routine is at least 29 ϕ periods (the response time is dependent upon how many privileged instructions are encountered when the request occurs). To establish time intervals greater than 51,200 ϕ clock periods is simply a matter of using the timer interrupt service routine to count the number of interrupts, saving the result in one or more of the scratchpad registers until the desired interval is achieved. With this technique, virtually any time interval, or several time intervals, may be generated.

The timer may be read at any time and in any mode using an input instruction (IN 7 or INS 7) and may take place "on-the-fly" without interfering with normal timer operation. Also, the timer may be stopped at any time by clearing bit 3 of the ICP. The timer holds its current contents indefinitely and resumes counting when bit 3 is again set. Recall, however, that the prescaler is reset whenever the timer is stopped; thus, a series of starting and stopping results in a cumulative truncation error.

A summary of other timer errors is given in the timing section. For a free-running timer in the interval timer mode, the time interval between any two interrupt requests may be in error by ± 6 ϕ clock periods, although the cumulative error over many intervals is zero. The prescaler and timer generate precise intervals for setting the timer interrupt request latch, but the time-out may occur at any time within a machine cycle. (There are two types of machine cycles: short cycles, which consist of 4 ϕ clock periods, and long cycles, which consist of 6 ϕ clock periods.) In the multi-chip F8 family, there is a signal called the write clock that corresponds to a machine cycle. Interrupt requests are synchronized with the internal write clock, thus giving rise to the possible ± 6 ϕ error. Additional errors may arise due to the interrupt request occurring while a privileged instruction or multi-cycle instruction is being executed. Nevertheless, for most applications all of the above errors are negligible, especially if the desired time interval is greater than 1 ms.

Pulse Width Measurement Mode—When ICP bit 4 is set (logic 1) and at least one prescale bit is set, the timer operates in the pulse width measurement mode. This mode is used for accurately measuring the duration of a pulse applied to the EXT INT pin. The timer is stopped and the prescaler is reset whenever EXT INT is at its inactive level. The active level of EXT INT is defined by ICP bit 2: if cleared, EXT INT is active LOW; if set, EXT INT is active high. If ICP bit 3 is set, the prescaler and timer start counting when EXT INT transitions to the active level. When EXT INT returns to the inactive level, the timer stops, the prescaler resets, and, if ICP bit 0 is set, an external interrupt request latch is set. (Unlike timer interrupts, external interrupts are not latched if the ICP interrupt enable bit is not set.)

As in the interval timer mode, the timer may be read at any time and may be stopped at any time by clearing ICP bit 3; the prescaler and ICP bit 1 function as previously described, and the timer still functions as an 8-bit binary down counter, with the timer interrupt request latch being set on the timer transition from H '01' to H 'N'. Note that the EXT INT pin has nothing to do with loading the timer; its action is that of automatically starting and stopping the timer and of generating external interrupts. Pulse widths longer than the prescale value times the modulo-N value are easily measured by using the timer interrupt service routine to store the number of timer interrupts in one or more scratchpad registers.

© IC MASTER 1983

As for accuracy, the actual pulse duration is typically slightly longer than the measured value because the status of the prescaler is not readable and is reset when the timer is stopped. Thus, for maximum accuracy, it is advisable to use a small division setting for the prescaler.

Event Counter Mode—When ICP bit 4 is cleared and all prescale bits (ICP bits 5, 6, and 7) are cleared, the timer operates in the event counter mode. This mode is used for counting pulses applied to the EXT INT pin. If ICP bit 3 is set, the timer decrements on each transition from the inactive level to the active level of the EXT INT pin. The prescaler is not used in this mode, but, as in the other two timer modes, the timer may be read at any time and may be stopped at any time by clearing ICP bit 3; ICP bit 1 functions as previously described, and the timer interrupt request latch is set on the timer transition from H '01' to H 'N'.

Normally, ICP bit 0 should be kept cleared in the event counter mode; otherwise, external interrupts are generated on the transition from the inactive level to the active level of the EXT INT pin.

For the event counter mode, the minimum pulse width required on EXT INT is 2 ϕ clock periods and the minimum inactive time is 2 ϕ clock periods; therefore, the maximum repetition rate is 500 Hz.

External Interrupts
When the timer is in the interval timer mode, the EXT INT pin is available for non-timer-related interrupts. If ICP bit 0 is set, an external interrupt request latch is set when there is a transition from the inactive level to the active level of EXT INT. (EXT INT is an edge-triggered input.) The interrupt request is latched either until acknowleged by the CPU section or until ICP bit 0 is cleared (unlike timer interrupt requests, which remain latched even when ICP bit 1 is cleared). External interrupts are handled in the same fashion when the timer is in the pulse width measurement mode or in the event counter mode, except that only in the pulse width measurement mode is the external interrupt request latch set on the trailing edge of EXT INT, that is, on the transition from the active level to the inactive level.

Interrupt Handling
When either a timer or an external interrupt request is communicated to the CPU section of the F38E70, it is acknowledged and processed at the completion of the first non-privileged instruction if the interrupt control bit of the status register is set. If the interrupt control bit is not set, the interrupt request continues until either the interrupt control bit is set and the CPU section acknowledges the interrupt or the interrupt request is cleared as previously described.

If there are both a timer interrupt request and an external interrupt request when the CPU section starts to process the requests, the timer interrupt is handled first.

When an interrupt is allowed, the CPU section requests that the interrupting element pass its interrupt vector address to the program counter via the data bus. The vector address for a timer interrupt is H '020'. The vector address for external interrupts is H '0A0'. After the vector address is passed to the program counter, the CPU section sends an acknowledge signal to the appropriate interrupt request latch, which clears that latch. The execution of the interrupt service routine then commences. The return address of the original program is automatically saved in the stack register, P.

Power-on Clear
When power is applied to the F38E70, the program counter and the ICB bit of the status register are cleared. Ports 4, 5, 6, and 7 are loaded with H '00' (thus, the I/O pins for ports 4 and 5 are at V_{OH}). The contents of other registers and ports are undefined. The first program instruction is then fetched from EPROM location H '000'.

External Reset
When $\overline{\text{RESET}}$ is taken LOW, the content of the program counter is pushed to the stack register, and the program counter and the ICB bit of the status register are then cleared. The original stack register content is lost. As with power-on clear, ports 4, 5, 6, and 7 are loaded with H '00'. The contents of all other registers and ports are unchanged. When $\overline{\text{RESET}}$ is taken HIGH, the first program instruction is fetched from EPROM location H '000'.

Test Logic
Special test logic is implemented to allow access to the internal main data bus for test purposes.

In normal operation, the TEST pin is unconnected or is connected to GND. When TEST is placed at a TTL level (2.0 V to 2.6 V), port 4 becomes an output of the internal data bus and port 5 becomes a wired-OR input to the internal data bus. The data appearing on the port 4 pins is logically true, whereas input data forced on port 5 must be logically false. When TEST is placed at a HIGH level (6.0 V to 7.0 V), the ports act as above and, additionally, the 2K x 8 program ROM is prevented from driving the data bus. In this mode, operands and

© IC MASTER 1983

instructions may be forced externally through port 5 instead of being accessed from the program ROM. When TEST is in either the TTL state or the HIGH state, STROBE ceases its normal function and becomes a cycle clock (identical to the F8 multi-chip system write clock, except inverted).

Timing complexities render the capabilities associated with the TEST pin impractical for use in a user's application, but these capabilities are sufficient to enable Fairchild to implement a rapid method for thoroughly testing the F38E70.

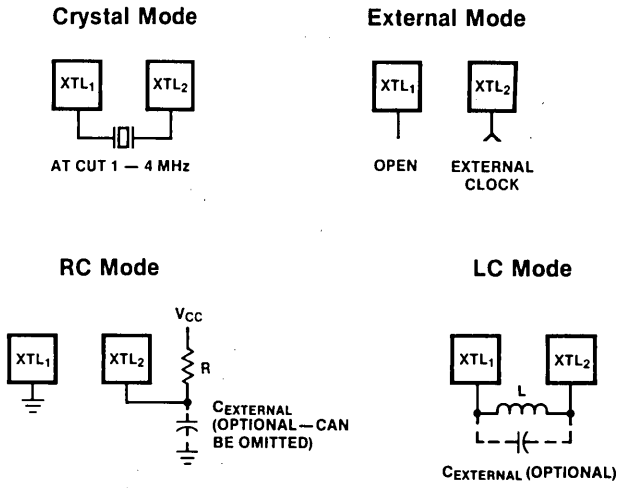
F38E70 Clocks

The time base for the F38E70 may originate in one of four external sources. The four external configurations are shown in *Figure 5*. There is an internal 20 pF capacitor between XTL_1 and GND, and also between XTL_2 and GND. Thus, external capacitors are not required. In all external clock modes, the external time base frequency is divided by two to form the internal ϕ clock.

Instruction Set

The F38E70 executes the entire instruction set of the multi-chip F8 family (F3850 family). Of course, the STORE instruction is of little use in the F38E70 because only read-only memory exists in the addressing range of the data counter (the data counter, however, is incremented if STORE is executed).

Fig. 5 Clock Configurations



Minimum $R = 4k\Omega$

$C = 20.5\ pF \pm 2.5\ pF + C_{EXTERNAL}$

$f_{MIN} \cong \frac{1}{1.1\,RC + 65\ ns}$

$f_{MAX} \cong \frac{1}{1.0\,RC + 15\ ns}$

Example with $C_{EXTERNAL} = 0$

$R = 15\ k\Omega \pm 5\%$

$f \cong 2.9\ MHz \pm 26\%$

Minimum $L = 0.1$ mH

Minimum $Q = 40$

Maximum $C_{EXTERNAL} = 30$ pF

$C = 10\ pF \pm 1.3\ pF + C_{EXTERNAL}$

$f \cong \frac{1}{2\pi\sqrt{LC}}$

Example with $C_{EXTERNAL} = 0$

$L = 0.3\ mH \pm 10\%$

$f \cong 3.0\ MHz \pm 10\%$

F6801/F6803
Single-Chip Microcomputer

Microprocessor Product

Description

The Fairchild F6801/F6803 is an 8-bit single-chip microcomputer unit (MCU) which significantly enhances the capabilities of the F6800 family. It includes an upgraded F6800 microprocessor unit (MPU) with upward-source and object-code compatibility. The F6801/F6803 MCU can function as a monolithic microcomputer or can be expanded to a 64K byte address space. Features of the F6801/F6803 MCU include:

- **Enhanced F6800 Instruction Set**
- **8 × 8 Multiply Instruction**
- **Serial Communications Interface (SCI)**
- **16-bit Three-Function Programmable Timer**
- **Bus Compatibility with the F6800 Family**
- **2048 Bytes of ROM (F6801 Only)**
- **128 Bytes of RAM**
- **64 Bytes of RAM, Retainable During Powerdown**
- **29 Parallel I/O and Two Handshake Control Lines**
- **Internal Clock Generator With Divide-by-Four Output**
- **Interrupt Capability**
- **TTL compatible**
- **40-Pin Ceramic or Plastic Package**
- **+5V Power Supply**

The F6801/F6803 MCU can be configured to function in a wide variety of applications. This flexibility is provided by its ability to be hardware-programmed into eight different operating modes. The operating mode controls the configuration of 18 of the 40 MCU pins, available on-chip resources, memory map, location of interrupt vectors, and type of external bus. Configuration of the remaining 22 pins is not dependent on the operating mode.

The F6803 can be considered an F6801 that operates in Modes 2 and 3 only (either internal RAM with no ROM, or no internal RAM or ROM, respectively).

F6809/F68A09/F68B09
Central Processing Unit

Microprocessor Product

Description

The Fairchild F6809 8-bit Microprocessor is an advanced, high-performance member of the F6800 family. It offers greater throughput, improved byte efficiency, and increased adaptability to various software disciplines, including position-independent code, re-entrancy, recursion, block structuring, and high-level language generation. The F6809 is compatible with all F6800 peripheral devices and is upward source code compatible with F6800-series microprocessors. The device is available in three frequency ranges: 1.0 MHz (F6809), 1.5 MHz (F68A09), and 2.0 MHz (F68B09).

Architectural improvements, such as additional 16-bit registers and dual 8-bit data paths, allow for powerful enhancements to the instruction set and addressing capabilities.

- **Compatible with Entire F6800 Family**
  - **—Hardware Interfaces with all F6800 Peripherals**
  - **—Software Has Upward-Compatible Instruction Set and Addressing Modes**
- **Two 16-Bit Index Registers**
- **Two Indexable 16-Bit Stack Pointers**
- **Two 8-Bit Accumulators Can Be Concatenated to Form One 16-Bit Accumulator**
- **Direct Page Register Allows Direct Addressing Throughout Memory Map**
- **Single +5 V Supply**
- **On-Chip Oscillator**
- **MRDY Input Extends Data Access Time for Use with Slow Memory**
- **DMA/BREQ Allows Access to Bus for DMA and Memory Refresh**
- **Fast Interrupt Request ($\overline{FIRQ}$) Stacks Only Program Counter and Condition Code Register**
- **Interrupt Acknowledge Output Allows Vectoring by Device**
- **Sync Acknowledge Output Allows for Synchronization to External Event**
- **16-Bit Arithmetic (ADD, SUBTRACT, COMPARE, LOAD, STORE)**
- **8 × 8 Unsigned Multiply**
- **Transfer/Exchange all Registers**
- **Push/Pull all Registers**
- **Ten Addressing Modes**
- **Expanded Indexed Addressing, Accumulator or up to 16-Bit Offset, Auto-Increment/Decrement by One or Two**
- **True Indirect Addressing**
- **Load-Effective Address**

Central Processing Unit

Microprocessor Product

Description

The Fairchild F6809E 8-bit microprocessor is an advanced, high-performance member of the F6800 family. It offers greater throughput, improved byte efficiency, and increased adjustability to various software disciplines, including position-independent code, re-entrancy, recursion, block structuring, and high-level language generation. The F6809E is compatible with all F6800 peripheral devices and is upward source code compatible with F6800-series microprocessors. It is available in three frequency ranges: 1.0 MHz (F6809E); 1.5 MHz (F68A09E); 2.0MHz (F68B09E).

Architectural improvements, such as additional 16-bit registers and dual 8-bit data paths, allow for powerful enhancements to the instruction set and addressing capabilities.

External clock inputs are provided on the F6809E to allow synchronization with peripherals, systems, or other MPUs.

- **Compatible with Entire F6800 Family**
  - **Hardware Interfaces with All F6800 Peripherals**
  - **Software Has Upward-Compatible Instruction Set and Addressing Modes**
- **Two 16-Bit Index Registers**
- **Two Indexable 16-Bit Stack Registers**
- **Two 8-bit Accumulators Can Be Connected to Form One 16-Bit Accumulator**
- **Direct Page Register Allows Direct Addressing Throughout Memory Map**
- **External E and Q Clock Inputs Allow Synchronization**
- **TSC Input Controls Internal Bus Buffers**
- **LIC Output Indicates Opcode Fetch**
- **AVMA Output Allows Efficient use of Common Resources in a Microprocessor System**
- **Fast Interrupt Request Input Stacks Only Program Counter and Condition Code Register**
- **Interrupt Acknowledge Output Allows Vectoring by Device**
- **Sync Acknowledge Output Allows for Synchronization to External Event**
- **Single Bus-Cycle Reset**
- **Single + 5 V Supply**
- **Early Address Valid Allows Use with Slower Memories**
- **Early Write-Data for Dynamic Memories**
- **10 Addressing Modes**
- **True Indirect Addressing**
- **Expanded Indexed Addressing**
- **1464 Instructions with Unique Addressing Modes**
- **Recognizes 8x8 Unsigned Multiply**
- **16-Bit Arithmetic**

F6845/F6845A
CRT Controller

Microprocessor Product

Description

The Fairchild F6845 CRT Controller (CRTC) provides an interface between a microprocessor (MPU) and a raster scan CRT device. The CRTC is used in microprocessor-based controller systems for CRT terminals in stand-alone or multiterminal configurations, including smart, programmable CRT terminals, video games, and information displays.

The F6845 CRTC is designed with an optimum hardware/software balance that achieves integration of all key functions and maintains flexibility. All keyboard functions, read/write operations, cursor movements, and editing are under microprocessor control. The F6845 provides video timing and refresh memory addressing.

- **Monochrome or Color CRT Applications**
- **Used with "Glass-Teletype", Smart, Programmable, Intelligent CRT Terminals; Video Games; Information Displays**
- **Alphanumeric, Semigraphic, and Full Graphic Capability**
- **Fully Programmable via Processor Data Bus; Timing can be Generated for Almost Any Alphanumeric Screen Format (e.g., 80 x 24, 72 x 64, and 132 x 20)**
- **Single +5 V Supply**
- **F6800-Compatible Bus Interface**
- **TTL-Compatible Inputs and Outputs**
- **Start Address Register Provides Hardware Scroll (By Page, Line, or Character)**
- **Programmable Cursor Register Allows Control of Cursor Format and Blink Rate**
- **Light Pen Register**
- **Refresh (Screen) Memory Can Be Multiplexed Between the CRTC and the MPU, Thus Removing the Requirements for Line Buffers or External DMA Devices**
- **Programmable Interlace or Non-Interlace Scan Modes**
- **14-Bit Refresh Address Allows up to 16K of Refresh Memory for Use in Character or Semigraphic Displays**
- **5-Bit Row Address Allows up to 32 Scan-Line Character Blocks**
- **512K Address Space is Available for Graphics System by Using Both the Refresh and Row Addresses**
- **Refresh Addresses are Provided During Retrace, Allowing the CRTC to Provide Row Addresses to Refresh Dynamic RAM**
- **Programmable Skew for Cursor and Display Enable (DE)**

F6856
Synchronous Protocol Communications Controller

Microprocessor Product

Description

The F6856 Synchronous Protocol Communications Controller (SPCC) is a monolithic n-channel MOS LSI circuit designed to satisfy the major interface requirements of the bit-oriented protocol (BOP) and byte-control protocol (BCP). The SPCC converts parallel data from the CPU into a continuous serial data stream for transmission. Simultaneously, it converts received serial data to parallel data for the CPU. The SPCC is organized to interface with either an 8- or 16-bit bidirectional data bus, is fully TTL-compatible, and operates from a single +5 V supply.

- F6800 and 8080 Bus Compatible
- Data Rate From DC to 1M BPS
- Bit-Oriented Line Control Protocols: SDLC, ADCCP, HDLC
  - Automatic Detection and Generation of Special Control Sequences (e.g., Flag, Abort, Go-Ahead)
  - Zero Insertion and Deletion
  - Primary or Secondary Station Select
  - Global Address
  - Automatic Extended Address
  - One or Two Control Bytes
  - Data Character Length From Five to Eight Bits with 1- to 8-Bit Residual Last Character
  - CCITT-CRC Error Detection
  - Interrupt on End of Message
  - IBM Retail Store Loop Mode
- Byte Control Protocol: IBM BISYNC
  - Special Character Generation: DLE, SYNC
  - Special Character Detection: DLE, SYNC, SOH, STX, ITB, ETB, ETX
  - ASCII or EBCDIC
  - Non-Transparent Mode and Transparent Mode
  - 8-Bit Character Length
  - Automatic Fill Character Insertion with Selectable Stripping
  - CCITT or CRC-16 Error Detection
  - Interrupt on End of Message
- Byte Control Protocols: DDCMP and Other Programmable SYNC Characters
  - 5- to 8-Bit Character Length
  - Selectable CRC Error Detection
  - Automatic Fill Character Insertion with Selectable Stripping
- Directly Addressable Parameter Control Registers: Mode, SYNC/Address, Transmitter Control, and Receiver Control
- Separate Addressable Status and Data Registers for Receiver and Transmitter
- Modem Handshake Signals: $\overline{RTS}$, $\overline{CTS}$, $\overline{DTR}$, $\overline{DSR}$, and $\overline{CD}$
- NRZ or NRZI (Zero-Complementing)
- Full- or Half-Duplex Operation
- Self-Test Loop Mode
- 8- or 16-Bit Bidirectional 3-State Data Bus
- TTL-Compatible
- Single +5 V Supply
- 40-Pin Package

Connection Diagram

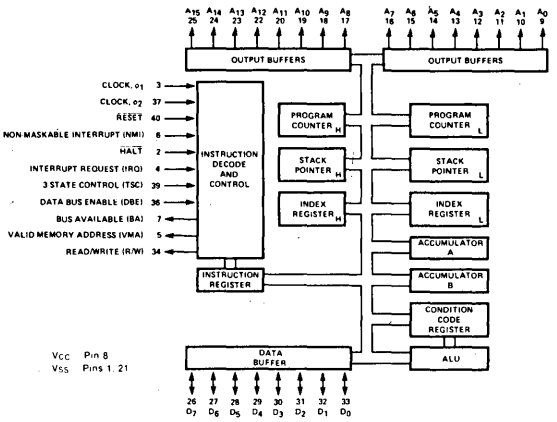
F6800 MICROPROCESSING UNIT (MPU)

GENERAL DESCRIPTION – The F6800 is a monolithic 8-bit microprocessor forming the central control function for Fairchild's F6800 family. Compatible with TTL, the F6800, as with all F6800 system parts, requires only one 5.0 V power supply and no external TTL devices for bus interface.

The F6800 is capable of addressing 65K bytes of memory with its 16-bit address lines. The 8-bit data bus is bi-directional as well as 3-state, making direct memory addressing and multiprocessing applications possible. Two temperature ranges are available. The F6800 is 0°C to 70°C and the F6800C is –40°C to +85°C.

- 8-BIT PARALLEL PROCESSING
- BI-DIRECTIONAL DATA BUS
- 16-BIT ADDRESS BUS – 65K BYTES OF ADDRESSING
- 72 INSTRUCTIONS – VARIABLE LENGTH
- SEVEN ADDRESSING MODES – DIRECT, RELATIVE, IMMEDIATE, INDEXED, EXTENDED, IMPLIED AND ACCUMULATOR
- VARIABLE LENGTH STACK
- VECTORED RESTART
- MASKABLE INTERRUPT VECTOR
- SEPARATE NON-MASKABLE INTERRUPT – INTERNAL REGISTERS SAVED IN STACK
- SIX INTERNAL REGISTERS – TWO ACCUMULATORS, INDEX REGISTER, PROGRAM COUNTER, STACK POINTER AND CONDITION CODE REGISTER
- DIRECT MEMORY ADDRESSING (DMA) AND MULTIPLE PROCESSOR CAPABILITY
- CLOCK RATES 1 MHz, 1.5 MHz, 2 MHz
- SIMPLE BUS INTERFACE WITHOUT TTL
- HALT AND SINGLE INSTRUCTION EXECUTION CAPABILITY
- TWO TEMPERATURE RANGES – F6800 0°C TO 70°C
  F6800C –40°C TO +85°C



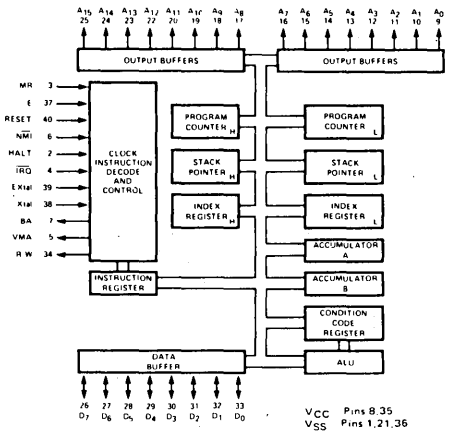
F6800 MPU

F6802/F6882 WITH CLOCK AND RAM

GENERAL DESCRIPTION — The F6802/F6882 is a monolithic 8-bit microprocessor that contains all the registers and accumulators of the F6800, plus an interval clock oscillator and driver on the same chip. It also has 128 bytes of RAM on-board, located at hex addresses $0000 to $007F.

The F6802/F6882 is completely software-compatible with the F6800 microprocessor and the entire F6800 family of parts.

- ON-CHIP CLOCK CIRCUIT
- 128 x 8-BIT ON-CHIP RAM
- 8 BYTES OF RAM ARE RETAINABLE ON THE F6882
- 32 BYTES OF RAM ARE RETAINABLE ON THE F6802
- SOFTWARE-COMPATIBLE WITH THE F6800
- STANDARD TTL-COMPATIBLE INPUTS AND OUTPUTS
- 8-BIT BIDIRECTIONAL DATA BUS
- 16-BIT MEMORY ADDRESSING
- INTERRUPT CAPABILITY



F6802/F6882 MPU

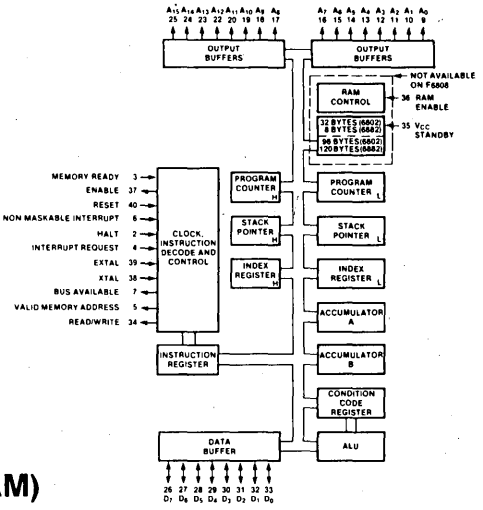
F6808 MPU WITH CLOCK

GENERAL DESCRIPTION – The F6808 is a monolithic 8-bit microprocessor that contains all the registers and accumulators of the present F6800 plus an internal clock oscillator and driver on the same chip.

The F6808 is completely software compatible with the F6800 as well as the entire F6800 family of parts. The F6808 is expandable to 65K words.

This very cost-effective MPU allows the designer to use the F6808 in consumer as well as industrial applications without sacrificing industrial specifications.

- ON-CHIP CLOCK CIRCUIT
- SOFTWARE COMPATIBLE WITH THE F6800
- EXPANDABLE TO 65K WORDS
- STANDARD TTL COMPATIBLE INPUTS AND OUTPUTS
- 8-BIT WORD SIZE
- 16-BIT MEMORY ADDRESSING
- INTERRUPT CAPABILITY



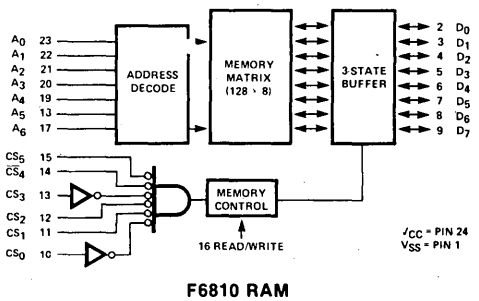
F6808 MPU

F6810 128 x 8-BIT RANDOM ACCESS MEMORY (RAM)

GENERAL DESCRIPTION – F6810 is a byte-organized memory designed for use in bus-organized systems. It is fabricated with N-channel silicon-gate technology. For ease of use, the device operates from a single power supply, has compatibility with TTL and DTL, and needs no clocks or refreshing because of static operation.

The memory is compatible with the F6800 Microcomputer Family, providing random storage in byte increments. Memory expansion is provided through multiple Chip Select inputs.

- ORGANIZED AS 128 BYTES OF EIGHT BITS
- STATIC OPERATION
- BI-DIRECTIONAL 3-STATE DATA INPUT/OUTPUT
- SIX CHIP SELECT INPUTS (FOUR ACTIVE LOW, TWO ACTIVE HIGH)
- SINGLE 5 V POWER SUPPLY
- TTL COMPATIBLE
- MAXIMUM ACCESS TIME = 350 ns – F6810-1
  450 ns – F6810



F6810 RAM

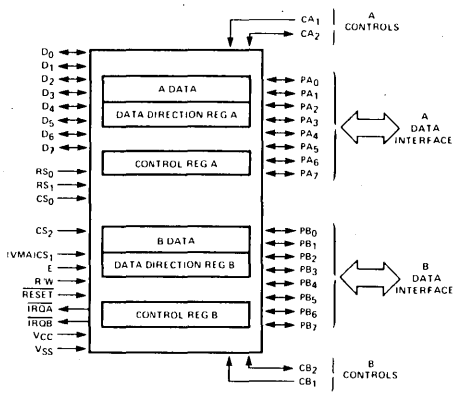
FAIRCHILD
A Schlumberger Company

F6821 PERIPHERAL INTERFACE ADAPTER (PIA)

GENERAL DESCRIPTION – The F6821 Peripheral Interface Adapter provides the universal means of interfacing peripheral equipment to the F6800 Microprocessing Unit (MPU). This device is capable of interfacing the MPU to peripherals through two 8-bit bi-directional peripheral data buses and four control lines. No external logic is required for interfacing to most peripheral devices.

The functional configuration of the PIA is programmed by the MPU during system initialization. Each of the peripheral data lines can be programmed to act as an input or output, and each of the four control/interrupt lines may be programmed for one of several control modes. This allows a high degree of flexibility in the overall operation of the interface.

- 8-BIT BI-DIRECTIONAL DATA BUS FOR COMMUNICATION WITH THE MPU
- TWO BI-DIRECTIONAL 8-BIT BUSES FOR INTERFACE TO PERIPHERALS
- TWO PROGRAMMABLE CONTROL REGISTERS
- TWO PROGRAMMABLE DATA DIRECTION REGISTERS
- FOUR INDIVIDUALLY-CONTROLLED INTERRUPT INPUT LINES; TWO USABLE AS PERIPHERAL CONTROL OUTPUTS
- HANDSHAKE CONTROL LOGIC FOR INPUT AND OUTPUT PERIPHERAL OPERATION
- HIGH IMPEDANCE 3-STATE AND DIRECT TRANSISTOR DRIVE PERIPHERAL LINES
- PROGRAM CONTROLLED INTERRUPT AND INTERRUPT DISABLE CAPABILITY
- CMOS DRIVE CAPABILITY ON SIDE A PERIPHERAL LINES



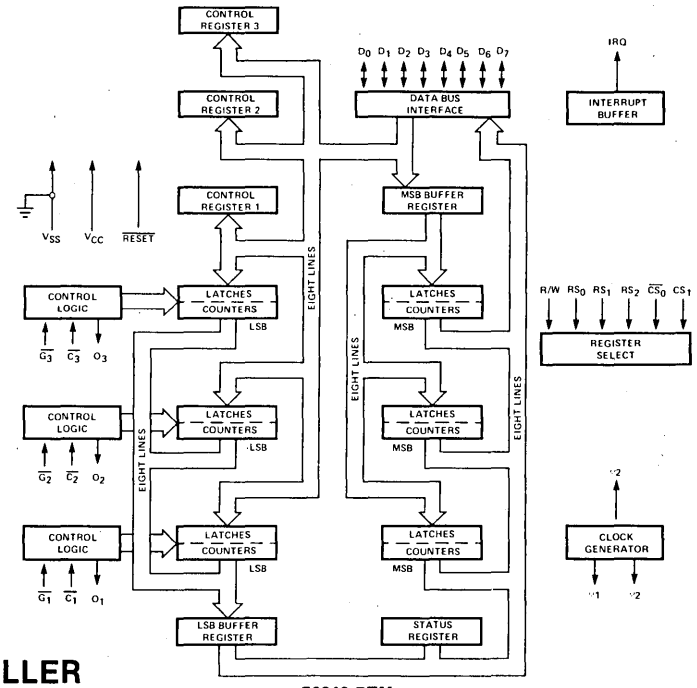
F6821 PIA

F6840 PROGRAMMABLE TIMER (PTM)

GENERAL DESCRIPTION—The F6840 is a programmable subsystem component of the F6800 family designed to provide variable system time intervals.

The F6840 has three 16-bit binary counters, three corresponding control registers and a status register. These counters are under software control and may be used to cause system interrupts and/or generate output signals. The F6840 may be utilized for such tasks as frequency measurements, event counting, interval measuring and similar tasks. The device may be used for square wave generation, gated delay signals, single pulses of controlled duration, and pulse width modulation as well as system interrupts.

- OPERATES FROM A SINGLE 5 VOLT POWER SUPPLY
- FULLY TTL COMPATIBLE
- SINGLE SYSTEM CLOCK REQUIRED (ENABLE)
- SELECTABLE PRESCALER ON TIMER 3 CAPABLE OF A 4 MHz INPUT
- PROGRAMMABLE INTERRUPTS ($\overline{IRQ}$) OUTPUTS TO MPU
- READABLE DOWN COUNTER INDICATES COUNTS TO GO TO TIME-OUT
- SELECTABLE GATING FOR FREQUENCY OR PULSE-WIDTH COMPARISON
- $\overline{RESET}$ INPUT
- THREE ASYNCHRONOUS EXTERNAL CLOCK AND GATE/TRIGGER INPUTS INTERNALLY SYNCHRONIZED
- THREE MASKABLE OUTPUTS



F6840 PTM

F6844 DIRECT MEMORY ACCESS CONTROLLER

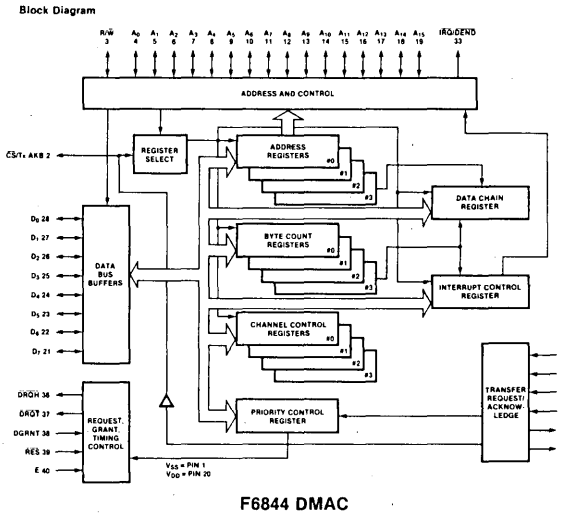
GENERAL DESCRIPTION — The F6844 Direct Memory Access Controller (DMAC) transfers data directly between memory and peripheral device controllers. In bus-organized systems, such as those based on the F6800 microprocessor, the DMAC, rather than the MPU, controls the address and data buses.

The DMAC bus interface includes select, read/write interrupt, transfer request/grant, and bus interface logic to permit data transfer over an 8-bit bidirectional data bus. The F6844 functional configuration is programmed through the data bus. The internal structure provides for control and handling of four individual channels, each of which is separately configured. Programmable control registers provide control for the transfer location and length, individual channel control and transfer mode configuration, priority of servicing, data chaining, and interrupt control. Status and control lines serve the peripheral controllers.

The mode of transfer for each channel can be programmed as cycle-stealing or burst transfer.

Typical applications include use with the F6856 Synchronous Protocol Communications Controller, the F6854 Advanced Data Link Controller, and the F68488 IEEE-488 Bus Controller.

- FOUR DMA CHANNELS, EACH HAVING A 16-BIT ADDRESS REGISTER AND A 16-BIT BYTE COUNT REGISTER
- 2M BYTE/SEC MAXIMUM DATA TRANSFER RATE
- SELECTION OF FIXED OR ROTATING PRIORITY SERVICE CONTROL
- SEPARATE CONTROL BITS FOR EACH CHANNEL
- DATA CHAIN FUNCTION
- ADDRESS INCREMENT OR DECREMENT UPDATE
- PROGRAMMABLE INTERRUPTS AND DMA END TO PERIPHERAL CONTROLLERS



F6844 DMAC

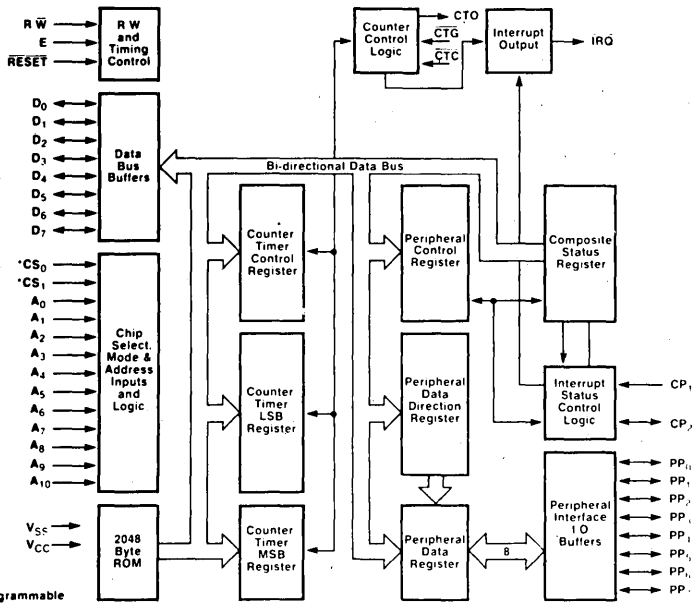
F6846 ROM-I/O-TIMER

GENERAL DESCRIPTION–The F6846 combination chip provides the means, in conjunction with the F6802, to develop a basic 2-chip microcomputer system. The F6846 consists of 2048 bytes of mask programmable ROM, an 8-bit bi-directional data port with control lines, and a 16-bit programmable timer-counter.

This device is capable of interfacing with the F6802 (basic F6800 clock and 128 bytes of RAM) as well as the F6800 if desired. No external logic is required to interface with most peripheral devices.

- 2048 8-BIT BYTES OF MASK-PROGRAMMABLE ROM
- 8-BIT BI-DIRECTIONAL DATA PORT FOR PARALLEL INTERFACE PLUS TWO CONTROL LINES
- PROGRAMMABLE INTERVAL TIMER-COUNTER FUNCTIONS
- PROGRAMMABLE I/O PERIPHERAL DATA, CONTROL AND DIRECTION REGISTERS
- COMPATIBLE WITH THE COMPLETE F6800 MICROCOMPUTER PRODUCT FAMILY
- TTL-COMPATIBLE DATA AND PERIPHERAL LINES
- SINGLE 5 VOLT POWER SUPPLY



*Mask Programmable

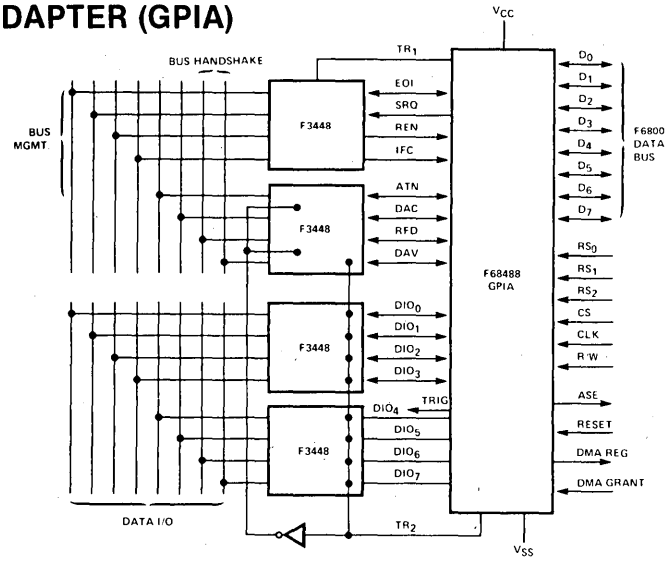
F6846 RIOT

F68488 GENERAL PURPOSE INTERFACE ADAPTER (GPIA)

GENERAL DESCRIPTION—The F68488 GPIA provides the means to interface between the IEEE 488 standard instrument bus and the F6800. The 488 instrument bus provides a means for controlling and moving data from complex systems of multiple instruments.

The F68488 will automatically handle all handshake protocol needed on the instrument bus.

- SINGLE OR DUAL PRIMARY ADDRESS RECOGNITION
- SECONDARY ADDRESS CAPABILITY
- COMPLETE SOURCE AND ACCEPTOR HANDSHAKES
- PROGRAMMABLE INTERRUPTS
- RFD HOLD-OFF TO PREVENT DATA OVERRUN
- OPERATES WITH DMA CONTROLLER
- SERIAL AND PARALLEL POLLING CAPABILITY
- TALK-ONLY OR LISTEN-ONLY CAPABILITY
- SELECTABLE AUTOMATIC FEATURES TO MINIMIZE SOFTWARE
- SYNCHRONIZATION TRIGGER OUTPUT
- F6800 BUS COMPATIBLE



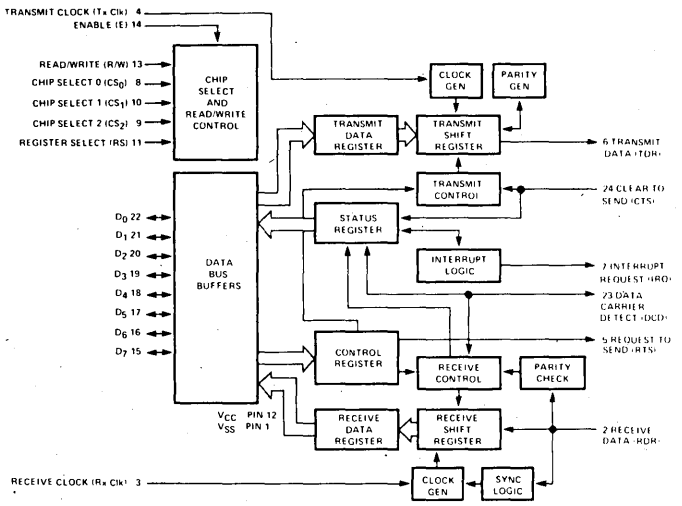
F68488 GPIA INTERFACE

F6850 ASYNCHRONOUS COMMUNICATIONS INTERFACE ADAPTER (ACIA)

GENERAL DESCRIPTION – The F6850 Asynchronous Communications Interface Adapter (ACIA) provides the data formatting and control to interface serial asynchronous data communications information to bus organized systems such as the F6800 Microprocessing Unit.

The bus interface of the F6850 includes select, enable, read/write, interrupt and bus interface logic to allow data transfer over an 8-bit bi-directional data bus. The parallel data of the bus system is serially transmitted and received by the asynchronous data interface, with proper formatting and error checking. The functional configuration of the ACIA is programmed via the data bus during system initialization. A programmable Control Register provides variable word lengths, clock division ratios, transmit control, receive control, and interrupt control. For peripheral or modem operation, three control lines are provided. These lines allow the ACIA to interface directly with the F6860 0-600 bps digital modem.

- 8 AND 9-BIT TRANSMISSION
- OPTIONAL EVEN AND ODD PARITY
- PARITY, OVERRUN AND FRAMING ERROR CHECKING
- PROGRAMMABLE CONTROL REGISTER
- OPTIONAL ÷1, ÷16, AND ÷64 CLOCK MODES
- UP TO 500 kbps TRANSMISSION
- FALSE-START BIT DELETION
- PERIPHERAL/MODEM CONTROL FUNCTIONS
- DOUBLE BUFFERED
- ONE OR TWO STOP BIT OPERATION



F6850 ACIA

FAIRCHILD
A Schlumberger Company

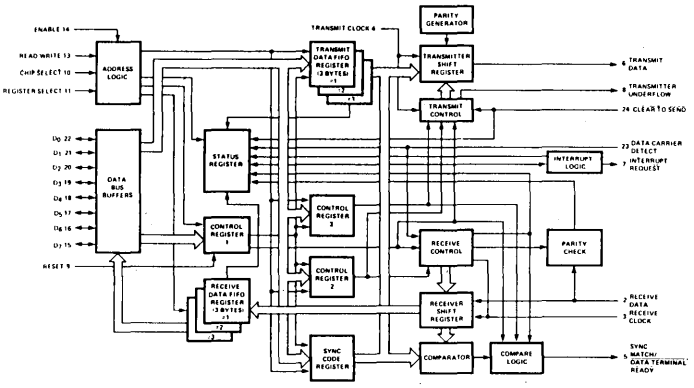
F6852 SYNCHRONOUS SERIAL DATA ADAPTER (SSDA)

GENERAL DESCRIPTION – The F6852 Synchronous Serial Data Adapter provides a bi-directional serial interface for synchronous data information interchange. It contains interface logic for simultaneously transmitting and receiving standard synchronous communications characters in bus organized systems such as the F6800 Microprocessor systems.

The bus interface of the F6852 includes Select, Enable, Read/Write, Interrupt, and bus interface logic to allow data transfer over an 8-bit bi-directional data bus. The parallel data of the bus system is serially transmitted and received by the synchronous data interface with synchronization, fill character insertion/deletion, and error checking. The functional configuration of the SSDA is programmed via the data bus during system initialization. Programmable control registers provide control for variable word lengths, transmit control, receive control, synchronization control, and interrupt control. Status, timing and control lines provide peripheral or modem control.

Typical applications include floppy disk controllers, cassette or cartridge tape controllers, data communications terminals, and numerical control systems.

- PROGRAMMABLE INTERRUPTS FROM TRANSMITTER, RECEIVER, AND ERROR DETECTION LOGIC
- CHARACTER SYNCHRONIZATION ON ONE OR TWO SYNC CODES
- EXTERNAL SYNCHRONIZATION AVAILABLE FOR PARALLEL-SERIAL OPERATION
- PROGRAMMABLE SYNC CODE REGISTER
- UP TO 600 KBPS TRANSMISSION
- PERIPHERAL/MODEM CONTROL FUNCTIONS
- THREE BYTES OF FIFO BUFFERING ON BOTH TRANSMIT AND RECEIVE
- SEVEN, EIGHT, OR NINE BIT TRANSMISSION
- OPTIONAL EVEN AND ODD PARITY
- PARITY, OVERRUN, AND UNDERFLOW STATUS



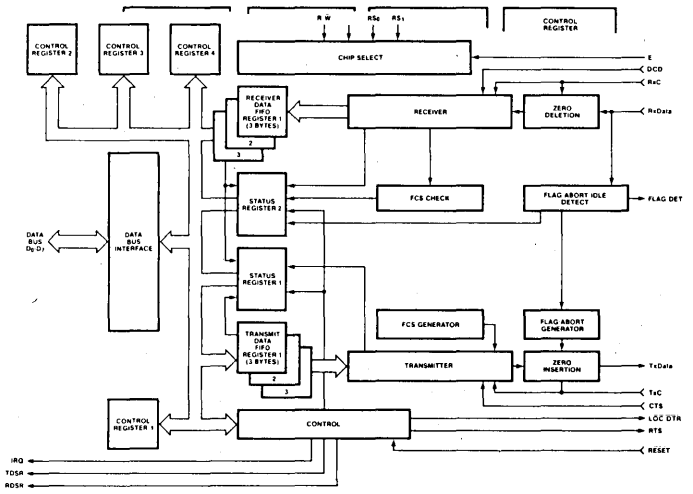
Vcc Pin 12
Vss Pin 1

F6852 SSDA

F6854 ADVANCED DATA LINK CONTROLLER (ADLC)

GENERAL DESCRIPTION — The F6854/F68A54 Advanced Data Link Controllers (ADLCs) perform the complex MPU/data communication link function for the Advanced Data Communication Control Procedure (ADCCP), High-level Data Link Control (HDLC) and Synchronous Data Link Control (SDLC) standards. The ADLC provides key interface requirements with improved software efficiency. The ADLC is designed to provide the data communications interface for both primary and secondary stations in stand-alone, polling and loop configurations.

- F6800 COMPATIBLE
- PROTOCOL FEATURES
  - AUTOMATIC FLAG DETECTION AND SYNCHRONIZATION
  - ZERO INSERTION AND DELECTION
  - AUTOMATIC ADDRESS FIELD EXTENSION (OPTIONAL)
  - EXTENDED CONTROL FIELD (OPTIONAL)
  - AUTO EXTENDABLE LOGIC CONTROL FIELD (OPTIONAL)
  - VARIABLE WORD LENGTH INFORMATION FIELD (5-, 6-, 7-, OR 8-BIT)
  - AUTOMATIC FRAME CHECK SEQUENCE GENERATION AND CHECK
  - ABORT DETECTION AND TRANSMISSION
  - IDLE DETECTION AND TRANSMISSION
- MODEM/DATA CHANNEL CONTROL LINES
- LOOP MODE
- SINGLE 5 V POWER SUPPLY
- ENHANCED SPEED OPTIONS



F6854 ADLC

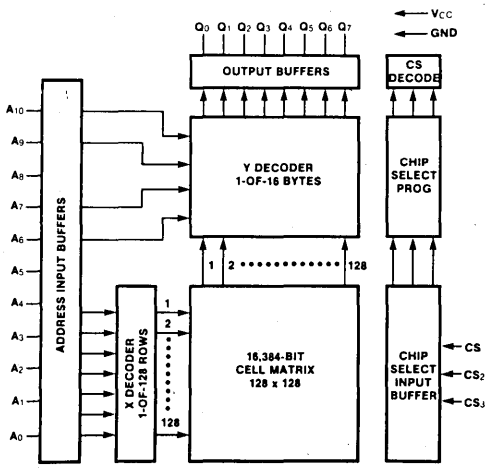
F35316/F68316 2048 × 8 ROM

GENERAL DESCRIPTION — The F35316/F68316 is a mask-programmable byte-organized MOS Read Only Memory (ROM) designed for use in bus-organized systems requiring non-volatile data storage. It is fabricated with n-channel silicon-gate technology. For ease of use, the F35316/F68316 operates from a single +5 V power supply, inputs and outputs are TTL and DTL compatible, and the device needs no clocks or refreshing because of its static operation.

The F35316/F68316 is compatible with the F6800, F8 and other microcomputer families providing read only storage in byte increments. To facilitate memory expansion, the device contains three programmable Chip Select inputs providing any combination of active HIGH or LOW or an optional DON'T CARE state coupled with output wired-OR capability. Chip select code and memory content are user defined and are fixed during the masking process.

The F35316/F68316 provides maximum circuit density, reliability and performance yet maintains low power dissipation and yields significant cost advantages over an EPROM approach.

- 2048 × 8-BIT BUS-COMPATIBLE ORGANIZATION
- FULLY STATIC OPERATION
- 3-STATE DATA OUTPUTS FOR WIRED-OR CAPABILITY
- MASK-PROGRAMMABLE CHIP SELECTS FOR SIMPLIFIED MEMORY EXPANSION
- SINGLE +5 V ±10% POWER SUPPLY
- TTL AND DTL-COMPATIBLE INPUTS
- MULTIPLE SPEED GRADES
  t_{ACC} = 250 ns, 300 ns (F35316)
  t_{ACC} = 350 ns, 450 ns, 500 ns (F68316)
- DIRECTLY COMPATIBLE WITH 2316E
- PIN COMPATIBLE WITH F2708 and F2716 EPROMs



F35316/F68316 ROM

© IC MASTER 1983

FAIRCHILD
A Schlumberger Company

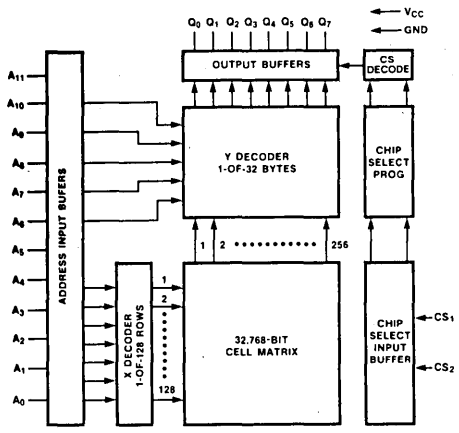
F3532/F68332/F3533 4096 × 8-BIT READ ONLY MEMORY (ROM)

GENERAL DESCRIPTION — The F3532/F68332 and F3533 are 4096 × 8-bit mask-programmable read only memories (ROMs), fabricated with n-channel silicon gate technology. They are designed for use in bus-organized systems requiring non-volatile data storage. For ease of use, the F3532/F68332 and F3533 require only a single +5 V power supply, have TTL-compatible inputs and outputs, and, due to their static operation, need no clocking or refreshing.

Electrically identical, the F3532/F68332 and F3533 represent both JEDEC standard pinouts, thus providing compatibility with other available 32K ROMs and EPROMs. To facilitate memory expansion, these devices offer two programmable Chip Select inputs whose active levels are user defined.

The F3523-30/F3533-30 and F3532/F3533-35 are high speed devices, allowing interface with faster generations of NMOS microprocessors.

- COMPLETELY STATIC OPERATION
- 8-BIT BUS COMPATIBLE ORGANIZATION
- 3-STATE OUTPUTS
- TWO-PROGRAMMABLE CHIP SELECT INPUTS
- SINGLE +5 V ± 10% SUPPLY
- FULLY TTL COMPATIBLE
- 3 SPEED GRADES—t_{ACC} = 300, 350, 450 ns
- BOTH JEDEC STANDARD PINOUTS
- PIN COMPATIBLE WITH OTHER 32K ROMs AND EPROMs



F3532/F68332/F3533 ROM

F3564 8192 × 8-BIT READ ONLY MEMORY (ROM)

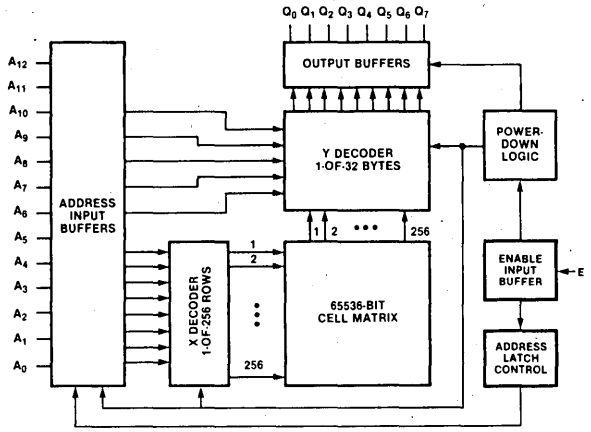
GENERAL DESCRIPTION — The F3564 8192 × 8-bit (64K) mask-programmable read-only memory (ROM) is designed for use in bus-organized systems requiring non-volatile memory storage. Because of its high speed, it readily interfaces with all generations of NMOS microprocessors.

Fabricated with n-channel silicon-gate technology, the F3564 has industry-standard pinouts and is compatible with other available 24-pin 16K, 32K, and 64K ROMs and EPROMs.

- ADDRESS LATCH FEATURE
- SINGLE 5 V POWER SUPPLY
- AUTOMATIC POWER-DOWN
- ACCESS TIME (t_{AA}) OF 250 ns FOR F3564-25 AND 350 ns FOR F3564-35
- LOW POWER DISSIPATION (440 mW, MAXIMUM, ACTIVE; 55 mW, MAXIMUM, STANDBY)
- FULLY TTL-COMPATIBLE
- THREE-STATE OUTPUT
- MASK-PROGRAMMABLE ENABLE FUNCTION
- PIN—COMPATIBLE WITH OTHER STANDARD 24-PIN 16K, 32K, AND 64K ROMs AND EPROMs

The programmable enable (E) input of the F3564 controls the output and the active-standby modes of operation. The active level of the E input and the memory contents are user-defined.

The F3564 requires only a single +5 V power supply, has TTL-compatible inputs and outputs, and, due to its static operation, requires no clocking or refreshing.



F3564 ROM

F3565 8192 × 8-BIT READ ONLY MEMORY (ROM)

GENERAL DESCRIPTION — The F3565 8192 × 8-bit (64K) mask-programmable read-only memory (ROM) is designed for use in bus-organized systems requiring non-volatile memory storage. Because of its high speed, it readily interfaces with all generations of NMOS microprocessors.

Fabricated with n-channel silicon-gate technology, the F3565 has industry-standard pinouts and is compatible with other available 24-pin 16K, 32K, and 64K ROMs and EPROMs.

- COMPLETELY STATIC OPERATION
- SINGLE 5 V POWER SUPPLY
- AUTOMATIC POWER-DOWN
- ACCESS TIME (t_{AA}) of 250 ns FOR F3565-25 AND 350 ns FOR F3565-35
- LOW POWER DISSIPATION (440 mW, MAXIMUM, ACTIVE; 55 mW, MAXIMUM, STANDBY)
- FULLY TTL-COMPATIBLE
- THREE-STATE OUTPUT
- MASK-PROGRAMMABLE ENABLE FUNCTION
- PIN-COMPATIBLE WITH OTHER STANDARD 24-PIN 16K, 32K, AND 64K ROMs AND EPROMs

The programmable enable (E) input of the F3565 controls the output and the active/standby modes of operation. The active level of the E input and the memory contents are user-defined.

The F3565 requires only a single +5 V power supply, has TTL-compatible inputs and outputs, and, due to its static operation, requires no clocking or refreshing.

FAIRCHILD
A Schlumberger Company

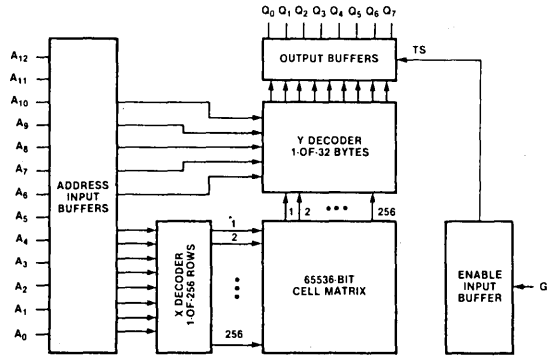
F3566 8192 × 8-BIT READ ONLY MEMORY (ROM)

GENERAL DESCRIPTION — The F3566 8192 × 8-bit (64K) read-only memory (ROM) is designed for use in bus-organized systems requiring non-volatile memory storage. Because of its high speed, it readily interfaces with all generations of NMOS microprocessors.

Fabricated with n-channel silicon-gate technology, the F3566 has industry-standard pinouts and is compatible with other available 24-pin 16K, 32K, and 64K ROMs and EPROMs.

- **COMPLETELY STATIC OPERATION**
- **SINGLE 5 V POWER SUPPLY**
- **HIGH-SPEED DATA VALID TIME OF 120 ns**
- **ACCESS TIME (t_{AA}) OF 250 ns for F3566-25 AND 350 ns F3566-35**
- **LOW POWER DISSIPATION (440 mW, MAXIMUM, ACTIVE)**
- **FULLY TTL-COMPATIBLE**
- **THREE-STATE OUTPUT**
- **MASK-PROGRAMMABLE ENABLE FUNCTION**
- **PIN-COMPATIBLE WITH OTHER STANDARD 24-PIN 16K, 32K, and 64K ROMs AND EPROMs**

The output enable (G) input controls the output and provides test data and valid time for high-speed microprocessor applications. The G input and the memory are user-defined.



F3566 ROM

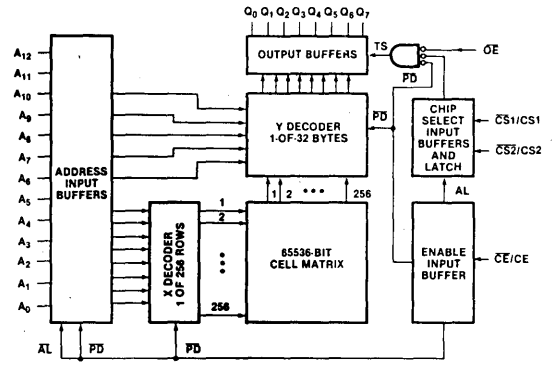
F3568 8192 × 8-BIT READ ONLY MEMORY (ROM)

GENERAL DESCRIPTION — The F3568 8192 × 8-bit (64K) mask-programmable, read-only memory (ROM) is designed for use in bus-organized systems requiring non-volatile memory storage. Because of its high speed, it readily interfaces with all generations of NMOS-microprocessors.

Fabricated with n-channel silicon-gate technology, the F3568 has industry-standard pinouts and is compatible with other available 64K ROMs and EPROMs.

- **ADDRESS LATCH FEATURE**
- **AUTOMATIC POWER-DOWN**
- **ACCESS TIME (t_{AA}) OF 250 ns FOR F3568-25 AND 350 ns FOR F3568-35**
- **LOW POWER DISSIPATION (440 mW, MAXIMUM, ACTIVE; 55 mW, MAXIMUM, STANDBY)**
- **FULLY TTL-COMPATIBLE**
- **THREE-STATE OUTPUTS**
- **MASK-PROGRAMMABLE ENABLE FUNCTION**
- **SINGLE 5 V POWER SUPPLY**
- **PIN-COMPATIBLE WITH OTHER STANDARD 28-PIN 64K PROMs AND EPROMs**

The chip enable (CE) input of the F3568 latches the addresses and controls the active and standby modes of operation; the output enable (OE) input controls the chip outputs and provides fast data valid time for high-speed microcomputer applications. Two chip select (CS) inputs are provided for memory expansion. The active levels of the CE and CS inputs, and the memory contents, are user-defined.



F3568 ROM

F3569 8192 × 8-BIT READ ONLY MEMORY (ROM)

GENERAL DESCRIPTION — The F3569 8192 × 8-bit (64K) mask-programmable read-only memory (ROM) is designed for use in bus-organized systems requiring non-volatile memory storage. Because of its high speed, it readily interfaces with all generations of NMOS microprocessors.

Fabricated with n-channel silicon-gate technology, the F3569 has industry-standard pinouts and is compatible with other available 28-pin 64K ROMs and EPROMs.

- **AUTOMATIC POWER-DOWN**
- **ACCESS TIME (t_{AA}) OF 250 ns FOR F3569-25 AND 350 ns FOR F3569-35**
- **LOW POWER DISSIPATION (440 mW, MAXIMUM, ACTIVE; 55 mW, MAXIMUM, STANDBY)**
- **FULLY TTL-COMPATIBLE**
- **THREE-STATE OUTPUTS**
- **MASK-PROGRAMMABLE ENABLE FUNCTION**
- **SINGLE 5 V POWER SUPPLY**
- **COMPLETELY STATIC OPERATION**
- **PIN-COMPATIBLE WITH OTHER STANDARD 28-PIN 64K ROMs and PROMs**

The chip enable (CE) input of the F3569 controls and acive and standby modes of operation; the output enable (OE) input controls the chip output and provides fast data available time for high-speed microcomputer applications. Two chip select (CS) inputs are provided for memory expansion. The active levels of the CE and CS inputs, and the memory contents, are user-defined.

F3570
64K ROM

Microprocessor Product

Description

The Fairchild F3570 8192 × 8-bit (64K) mask-programmable, read-only memory (ROM) is designed for use in bus-organized systems requiring non-volatile memory storage. Because of its high speed, it readily interfaces with all generations of NMOS microprocessors.

Fabricated with n-channel silicon-gate technology, the F3570 has industry-standard pinouts and is compatible with other available 28-pin 64K ROMs and EPROMs.

- **Access Time (t_{AA}) of 250 ns for F3570-25 and 350 ns for F3570-35**
- **High-Speed Data Valid Time of 120 ns**
- **Low Power Dissipation (440 mW, Maximum, Active)**
- **Fully TTL-Compatible**
- **Three-State Outputs**
- **Mask-Programmable Chip Select Active Levels**
- **Single 5 V Power Supply**
- **Completely Static Operation**
- **Pin-Compatible with Other Standard 28-Pin 64K ROMs and EPROMs**

The output enable (OE) input controls the chip output and provides fast data valid time for high-speed microprocessor applications. Two chip select ($\overline{CS}$) inputs are provided for memory expansion. The active levels of the CS inputs, and the memory contents, are user-defined.

The F3570 requires only a single +5 V power supply, has TTL-compatible inputs and outputs, and, due to its static operation, requires no clocking or refreshing.

F9443
Floating-Point Processor

Microprocessor Product

Description

The F9443 Floating-Point Processor is designed to provide enhancement to the numeric capabilities of 16-bit microprocessors by providing a set of floating-point instructions. It can interface with the F9445, F9450 or any other standard 16-bit microprocessor, and it uses the microprocessor memory to directly fetch the required operands. It has eight general-purpose registers on-chip and supports all the basic functions with on-chip microcode. Use of additional off-chip microcode read-only memories (ROMs) provides extended capabilities. Figure 1 is a block diagram of the F9443.

Circuit Description

The F9443 includes special hardware to provide fast algorithms for the basic functions. This hardware includes full-carry look-ahead for add and subtract (ADD/SUB) functions, recoding logic for multiply and square root functions, and partial-remainder-prediction logic for divide functions. An advanced control scheme provides a 2-level microcode/nanocode control with off-chip microcode expansion. The off-chip microcode can be programmable ROM (PROM) or random-access memory (RAM), with easy expansion for fast implementation of user algorithms.

Operation of the F9443 can proceed in parallel with the host processor to maximize throughput. Multiple F9443s can be connected to the host processor for array processing or other high-speed applications.

- **Full IEEE SP D DX Floating-Point Standard Support (80 Bits)**
- **Fast Algorithms for Add, Subtract, Multiply, Square Root, and Divide Functions**
- **Support for Full Set of Trigonometric Exponential and Logarithmic Functions**
- **Expandable Instruction Set That Can Include Macro Operations (e.g., Vector rotate, Fourier Transform, Array and Matrix Applications)**
- **User-Alterable Microcode for User Functions**
- **Support of Integer Decimal and Logical Functions**
- **Standard 64-Pin Package**
- **I^3L® High Speed Bipolar Logic**
- **Low-Power Schottky-Compatible I/O**
- **Very Fast Execution Times**
- **Interface to Any 16-Bit Microprocessor**

F9444
Memory Management and Protection Unit

Microprocessor Product

Description

The Fairchild F9444 programmable Memory Management and Protection Unit (MMPU) is designed to support complex multi-user and large single-user environments. With four F93422 bipolar static random-access memories (RAMs) serving as map memory, the F9444 expands the physical address space of the F9445 16-bit microprocessor to 2M words by performing logical-to-physical address translation. That is, the six most significant bits (MSBs) of the logical address are translated into 11 physical address bits, leaving the 10 least significant bits (LSBs) of the logical address unchanged. The memory thus consists of 21 bits (10 LSB and 11 MSB), or 4 megabytes. System integrity is maintained by access protection bits associated with each page. Any violation causes non-maskable interrupt to the F9445 central processing unit. Page-written (PW) and page-referenced (PR) bits permit the implementation of demand-paging algorithms. Figure 1 is a functional diagram of the MMPU.

- **Standard Input/Output (I/O) Instruction Format**
- **Ability to Implement Demand-Paged Virtual Memory System**
- **Ability to Access Up to 2M Words of Memory**
- **2K Pages, With 1K Words for Each Page**
- **Memory Expansion Through Mapping and Demand Paging**
- **Controls for Memory Mapping**
- **Separate RAMs for Storing Maps**
- **Access and I/O Protection to Maintain System Integrity**
- **Special Status Bits for Read/Write Protection, Demand Paging, and I/O Protection**
- **Support for Two User and Two Data Channel Maps**
- **Low-Power Schottky-Compatible I/O**
- **Single +5 V Power Supply**
- **64 Pin Dual-in-Line Package (DIP)**
- **I^3L® Technology**

F9445
16-Bit Bipolar Microprocessor

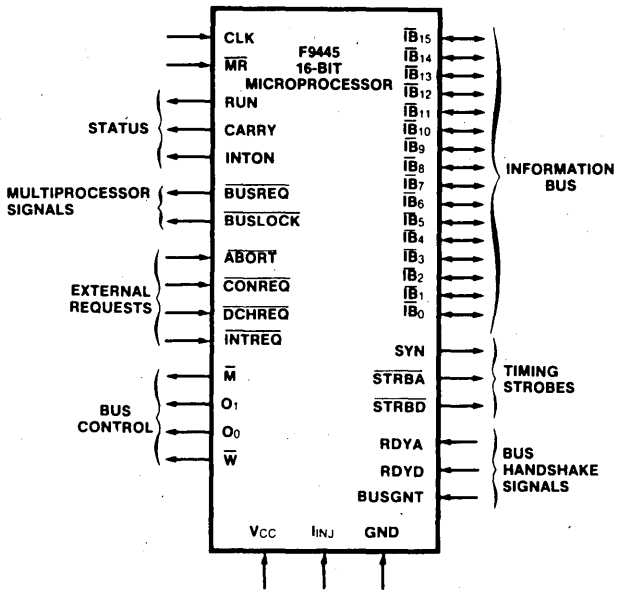
Microprocessor Products

Description

The F9445 is a 16-bit microprocessor implemented using Fairchild's Isoplanar Integrated Injection Logic ($I^3L^{®}$) technology. This bipolar technology and a sophisticated pipeline architecture combine to give the F9445 very fast execution times. The processor has eight program-accessible registers and the capability of directly addressing 128K bytes (64K words) of memory. Up to 4M bytes of physical memory may be accessed using the F9444 memory management unit. The F9445 can address 62 I/O devices, handle 16 levels of priority interrupt, and perform fast direct memory access. It has control lines to provide operator-console functions and has an on-chip self-test program. The F9445 CPU is supported with a comprehensive family of LSI support circuits to permit cost and performance effective usage in high-performance microcomputer systems. The support circuits include the F9446 Dynamic Memory Controller, F9447 I/O Controller, F9448 Programmable Multiport Interface, F9449 Multiple Data Channel Controller, F9444 Memory Management Unit and F9470 Console Controller. It is also supported with a library of software packages, including editors, debuggers, macro-assembler, relocating loader, real-time executive, interactive multi-user disk operating system and utilities, as well as high-level languages: FORTRAN, BASIC and PASCAL.

- **Advanced Parallel Architecture Leading to Very Fast Execution Times—250 ns Register to Register, 2.9 μs 16 × 16 Bit Multiply**
- **Directly Addresses up to 128K Bytes of Memory with 11 Addressing Modes**
- **Eight Program-Accessible Registers (AC0, AC1, AC2, AC3, SP, FP, PC, PSW)**
- **Versatile Instruction Set Including Memory Reference, ALU, I/O, Stack, Multiply/Divide, and Floating Point Assist (Scale/Normalize) Instructions with 8-Bit Byte, 16-Bit Word or 32-Bit Double-Word Data**
- **Multi-Processing Capabilities**
- **Flexible Operator-Control Functions and Self-Test**
- **Static Operation with Single Clock up to 24 MHz**
- **LS TTL Input/Output Structure with I^3L Internal Circuits**
- **40-Pin DIP Needing a Single +5 V Power Supply**
- **Full Military Temperature and Voltage Ranges**
- **Radiation-Tolerant Technology**
- **Comprehensive Family of Support Circuits**

Pin Functions



Connection Diagram
40-Pin DIP

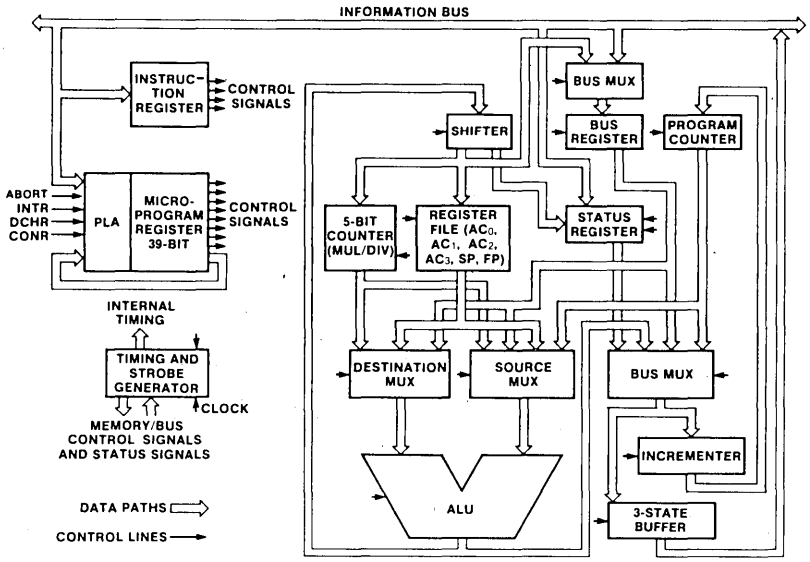
Fig. 1 F9445 Functional Diagram



Architecture

The F9445 microprocessor comprises three main blocks: the data path, the control unit, and the timing generator.

Data Path

The data path is 16 bits wide and is responsible for all the processing of data and address in the system. In many cases, data and address may be processed simultaneously.

The data path includes the following blocks (see *Figure 1*):
Register File (AC0, AC1, AC2, AC3, SP, FP)
Program Counter (PC)
Program Status Word or Status Register (PSW containing: Carry, Overflow, 32KW, ETRP flags)
Interrupt-On Flip-Flop (INTON)
Destination Mux
Source Mux
16-Bit ALU
17-Bit Shifter
5-Bit Counter (for multicycle instructions)
Bus Register Mux
Bus Register
Bus Mux and Buffer
Incrementer

Control Unit

The operations of the data path components are governed by the pipelined, microprogrammed control unit. This unit comprises three main elements (see *Figure 1*): the PLA (control store) to contain the microprogram, the pipeline register (microprogram register) to latch the microinstruction executed in the current cycle, and the instruction register to supply additional control bits during certain instructions. In addition, the control unit has a machine instruction pre-fetch mechanism which overlaps the fetching of the next instruction from memory during execution of short-cycle instructions, such as arithmetic-and-logic (ALU) instructions. This pre-fetch capability and the microprogram pipeline give the F9445 very fast and efficient instruction execution.

Timing Generator

The timing generator produces the system timings for the F9445 internal registers, memory, I/O, and console.

The clock is divided on-chip using a 3-bit twisted ring counter. The divide ratio is 6:1 or 4:1, depending on whether a short or long cycle is required. The long cycle can be extended indefinitely by lowering the inputs BUSGNT, RDYA, or RDYD. These signals hold the processor in state S1 (using BUSGNT or RDYA) or S3 (using RDYD) until the inputs are raised.

The twisted ring counter is also used to generate all the strobes by a combinational decode of its outputs and certain bits of the microprogram register.

Signal Descriptions

All F9445 inputs and outputs are TTL.

Information Bus

$\overline{IB}_0$ through $\overline{IB}_{15}$, Pins 11 through 26 — 16-bit Bus — Active LOW bidirectional; $\overline{IB}_0$ is most significant bit; address valid

© IC MASTER 1983

with $\overline{STRBA}$ strobe; data valid with $\overline{STRBD}$ strobe; 3-state during data-channel and non-bus cycles.

Timing and Status

SYN, Pin 7 — Synchronize Output — Active every cycle; may be used for external synchronization of memory and I/O control.

$\overline{STRBD}$, Pin 6 — Data Strobe — Active LOW output; active only during memory, I/O, console, or data-channel cycles; used as strobe for data.

$\overline{STRBA}$, Pin 5 — Strobe Memory Address Register — Active LOW output; active only during normal memory cycles; not active during write portion of read-modify-write cycles (DSZ, ISZ, STB instructions and auto-increment/decrement addressing modes); used as strobe for external address register; active on I/O cycles when I/O instruction is output onto bus.

$\overline{M}$, Pin 36 — Memory or I/O Function — Active LOW output.
O_1, Pin 35 — Memory or I/O Function — Active HIGH output.
O_0, Pin 34 — Memory or I/O Function — Active HIGH output; these pins indicate the type of bus transfer as shown in the following table.

	$\overline{M}$	O_1	O_0	Function
Memory	0	0	0	Instruction Fetch
	0	0	1	Operand
	0	1	0	Indirect Address
	0	1	1	Address Save on interrupt, abort, and trap
I/O	1	0	0	Input or Output
	1	0	1	Data Channel Acknowledge
	1	1	0	Read Console Code
	1	1	1	Console Data

If a skip is taken on an arithmetic-and-logic (ALU) instruction, the next instruction is fetched but not executed. In such fetches, the $\overline{M}$ and O lines will indicate the following states.

$\overline{M}$	O_1	O_0	State Indicated
0	0	0	S0 through S4
0	0	1	S5

During machine cycles that do not use the bus, the $\overline{M}$ and O lines will be "111". $\overline{BUSREQ}$ and the bus strobes are inactive in these cycles.

$\overline{W}$, Pin 1 — Write Output — Indicates direction of data flow; HIGH indicates a read or input operation; LOW indicates a write or output operation; 3-state during data-channel cycles and short cycles ($\overline{BUSREQ}$ is HIGH).

RDYD, Pin 8 — Data Ready — Active HIGH input; used to synchronize external devices with the F9445 during data transfer; a LOW level halts the processor.

RDYA, Pin 4 — Address Ready — Active HIGH input; maintains address on bus when LOW.

RUN, Pin 37 — Run Status — Active HIGH output; LOW when in halt state.

CARRY, Pin 39 — Carry Status — Active HIGH output; copy of carry bit.

INTON, Pin 27 — Interrupt-On Status — Active HIGH output; copy of Interrupt-On flag; HIGH when interrupts enabled.

CLK, Pin 40 — Clock Input — Single-phase clock; positive-edge triggered.

Arbitration

$\overline{BUSREQ}$, Pin 38 — Bus Request — Active LOW output; indicates that a bus cycle is required; useful in multi-microprocessor system.

$\overline{BUSLOCK}$, Pin 2 — Bus Lock — Active LOW open collector output; set during read portion of read-modify-write cycles (on DSZ, ISZ, STB, and auto-increment/decrement), reset during write portion of those cycles; used in multi-microprocessor system.

BUSGNT, Pin 3 — Bus Grant — Active HIGH input; used for multi-microprocessor operation; a LOW level inhibits address output and halts the processor.

Service Request

The order of priority of requests and interrupts, from highest to lowest, is as follows: $\overline{MR}$, $\overline{ABORT}$, $\overline{DCHREQ}$, Stack Overflow Interrupt, $\overline{INTREQ}$, and $\overline{CONREQ}$.

$\overline{MR}$, Pin 33 — Master Reset — Active LOW input; a LOW level causes the processor to enter a wait state after completing the next full cycle; if that cycle is a write, it is inhibited (changed to read); sets the F9445 to 32K mode with trap enabled.

$\overline{DCHREQ}$, Pin 29 — Data Channel Request — Active LOW input; initiates data-channel cycles while LOW after current instruction.

$\overline{CONREQ}$, Pin 28 — Console Request — Active LOW input; initiates a console operation after current instruction.

© IC MASTER 1983

$\overline{\text{INTREQ}}$, Pin 30 — Interrupt Request — Active LOW input; initiates entry to interrupt procedure, if interrupts are enabled, after the current instruction.

$\overline{\text{ABORT}}$, Pin 32 — Abort — Active LOW input; initiates abort sequence in the current microcycle.

Power

V_{CC}, Pin 31 — Power Supply — Requires +5 V.

GND, Pin 9 — Ground.

I_{INJ}, Pin 10 — Injection Current Input — Operates in 200-400 mA range at approximately 1 V; requires > 350 mA for maximum speed.

Register Set

The F9445 has eight user-accessible registers (see Figure 2), including seven 16-bit registers and a program status word (PSW) containing the following four flags: carry (bit 0), 32KW (bit 1), trap enable (bit 2), and overflow (bit 15). The carry flag (C) indicates the state of the carry bit during arithmetic and logic operations. The 32KW flag indicates whether the processor is operating in the 32K-word ("1") or 64K-word ("0") mode. The trap enable/disable flag (ETRP) indicates whether the trap instruction is enabled ("1") or disabled ("0"). The overflow flag (V) indicates twos-complement overflow in arithmetic operations.

In addition, there is an interrupt-on (INTON) flag. The CPU responds to interrupt requests from external I/O devices when the flag is set ("1"). When it is clear ("0"), all interrupt requests are ignored by the CPU. The state of the flag can be altered by the Interrupt-Enable or Interrupt-Disable instruction.

F9446
Dynamic Memory Controller

Microprocessor Product

Description

The Fairchild F9446 Dynamic Memory Controller (DMC) is designed to support a variety of memory configurations and provide an interface between 16K and 64K memory chips and the F9445 central processing unit (CPU). It provides a 16-bit memory address register (MAR), an address multiplexer for the row, column, and refresh addresses, a timing generator for the row and column strobe signals and the write enable signal (RAS-CAS-WE), mode arbitration, and page mode logic. It is implemented in I^3L® bipolar technology with low-power Schottky-compatible inputs and outputs.

- **16-bit Memory Address Register**
- **Ability to Accommodate a Variety of Memory Speeds**
- **16K or 64K DRAMs**
- **Automatic Page Mode**
- **Internal Refresh Address Counter**
- **Row/Column/Refresh Multiplexer**
- **Complete Memory Timing Signals**
- **Three-state Outputs for Multiport Memories**
- **Internal Refresh Rate Timer**
- **Low-power Schottky-compatible I/0**
- **I^3L Bipolar Technology**
- **64-Pin DIP**
- **Operating Temperature Range of from −55°C to +125°C**

F9447
I/O Bus Controller

Microprocessor Product

Description

The F9447 I/O Bus Controller (IOC) is used with the F9445 I^3L® 16-Bit Bipolar Microprocessor to demultiplex the I/O instruction and data of the information bus (IB). It provides all the timing and decode signals required for programmed or data channel (DCH) input/output to peripheral device controllers. In the NOVA® -compatible mode, the F9447 provides all the timing and signals required by that I/O bus. For DCH transfers, address generation and handshake can be handled by the F9449 Multiple Data Channel Controller.

- **Interfaces Directly to the F9445**
- **Controls Standard and High-Speed NOVA-Compatible Data Channels**
- **NOVA-Compatible or F9445 I/O and Data Channel Timing**
- **Complete NOVA-Compatible I/O Bus Interface**
- **Automatic Program Load**
- **Power-Up Reset Delay**
- **Console Interface**
- **Local Busy/Done/Interrupt Logic**
- **Low-Power Schottky-Compatible I/O**
- **64-Pin DIP or Optional Chip Carrier Package**
- **I^3L Technology**
- **Operating Temperature Range of from −55°C to +125°C**

F9448
Programmable Multiport Interface

Microprocessor Product

Description

The F9448 Programmable Multiport Interface (PMI) is 64 pin bipolar I^3L device that facilitates the interface between an F9445 16-bit bipolar microprocessor and many industry-standard input/output (I/O) devices. It decodes I/O instructions and memory addresses from the central processing unit (CPU) to communicate with devices tied to its four external ports. When used with the F9449 Multiple Data Channel Controller, it handles peripheral selection and timing during data channel cycles. Some of the features of the F9448 are:

- **Four Independent I/O Ports**
- **Memory-Mapped and Programmed I/O**
- **Interface with Serial, Parallel, DMA, and Other Special-Purpose Devices**
- **Programmable Peripheral Timing**
- **Compatibility with Many Industry-Standard Interfaces**
- **Ability to Implement F9445-Programmed I/O Flags**
- **Interrupt Arbitration and Response Handling**
- **Fabricated in I^3L® Bipolar VLSI Technology**
- **Operating Temperature Range −55° to +125°C**
- **64-Pin Package**
- **Low-Power Schottky Compatible I/O**

The F9448 PMI ties the F9445 CPU to many industry-standard microprocessor interfaces. It easily links I/O devices designed for the F6800 or 8080 buses and those directly suitable for the F9445 I/O bus. The system configuration in figure 1 shows how the F9448 can be used to interface F6800, 8086 family I/O devices or the F3870 to the F9445 system.

F9449

Multiple Data Channel Controller

Microprocessor Product

Description

The F9449 Multiple Data Channel Controller is a 4-port controller that is used with the Fairchild F9445 16-Bit Bipolar Microprocessor, and either an F9447 I/O Bus Controller or an F9448 Programmable Multiport Interface, to control direct data transfer to and from memory by peripheral devices. It contains four pairs of program-controlled address and word count registers that are multiplexed to control four fully independent data channels (DCHs) through which data transfers can occur. Data channel transfers are similar to direct memory access (DMA) channel transfers, except that the F9445 architecture time-shares its information bus (IB).

- **Provides Control of Four Independent Channels**
- **Has Separate Word Count and Memory Address Registers for Each Channel**
- **Supports Byte- or Word-mode Operation on Each Channel**
- **Performs Internal Priority Arbitration**
- **Supports Memory-to-Memory Transfers**
- **Implemented in I^3L® Technology, with Low-power Schottky TTL-compatible Input and Output**
- **Available in a 64-Pin Package.**
- **Operating Temperature Range of from −55°C to +125°C**

F9470
Communication and Console Controller

Description

The Fairchild F9470 Communication and Console Controller is an LSI MOS device that provides the Fairchild F9445 16-bit I³L® microprocessor with virtual console control and programmed serial I/O via a pair of asynchronous communication ports.

The F9470 provides a variety of useful console functions, including examine and deposit to memory and accumulators, jump to a specified location, and trace the F9445 instruction execution.

The F9470 operates in two modes: console control and I/O service. In the console mode, all communication with the F9445 is controlled by the F9470, which interprets user commands, requests the appropriate information from the F9445, and then outputs it to the operator's terminal.

In the I/O service mode, the F9470 acts as a serial I/O controller, interfacing the serial I/O devices to the F9445 through device codes 10-13 and 77. The console commands are not available while in the I/O service mode; all I/O in this mode is programmed through the F9445.

- **Accesses Microprocessor Internal Registers**
- **Two Asynchronous Serial Ports**
- **Allows CRT Terminal to Operate as a Console for an F9445 System**
- **40-Pin DIP Requiring Single +5 V Power Supply**
- **NMOS Technology.**

F16000 Family

Features

- True 32-Bit Internal Architecture
- 16M Bytes of Uniform, Unsegmented Address Space
- Eleven Addressing Modes
- Demand-Paged Virtual Memory Management
- Totally Symmetric Architecture in Terms of Instructions, Addressing, Registers, and Data-Type Handling
- Efficient Use of High-Level Language Processing and Compilation
- Provides for Absolute Software Modularity
- Open-Ended Architecture Provides for Future Expansion

Device	Description
F16008	8-Bit Processor Unit
F16016	16-Bit Bilingual Processor Unit
F16032	32-Bit Processor Unit
F16081	Floating-Point Processor Unit

F16032
High-Performance CPU

Microprocessor Product

Description

The F16032 central processing unit (CPU) acts as the highest performance CPU for the F16000 microprocessor family. It is designed to provide optimal support to microprocessor users who need a large addressing space for large programs or data structures. The F16000 architecture allows very efficient compilation for large programs generated and maintained in high-level languages, while remaining easy to program at the assembler level for optimizations. Figure 1 is a block diagram of the F16032 CPU.

- **32-Bit Architecture and Implementation**
- **16-Mb Uniform Addressing Space**
- **Two-Address Architecture**
- **High Degree of Symmetry in Instruction Set**
- **Addressing Modes Designed to Support High-Level Language Accesses to Variables**
- **High-Speed N-Channel MOS Technology**
- **Single +5 V Power Supply**
- **48-Pin Dual In-Line Package (DIP)**

Table 1 F16032 Instruction Summary (Cont'd.)

Mnemonic	Meaning
NEG	Negate
NOP	No Operation
NOT	Not
OR	Or
QUO	Quotient
RDVAL	Read Address Validate
REM	Remainder
RESTORE	Restore General Registers
RET	Return from Subroutine
RETI	Return from Interrupt
RETT	Return from Trap
ROT	Rotate
RXP	Return from External Procedure
S	Set on Condition
SAVE	Save General Registers
SBIT	Set Bit
SETCFG	Set Configuration
SKPS	Skip String
SMR	Store MMU Register
SPR	Store Processor Register
SUB	Subtract
SUBC	Subtract with Borrow
SUBP	Subtract Packed Decimal
SVC	Supervisor Call
TBIT	Test Bit
WAIT	Wait
WRVAL	Write Address Validate
XOR	Exclusive OR

Figure 2 F16032 Dedicated and General Storage Registers

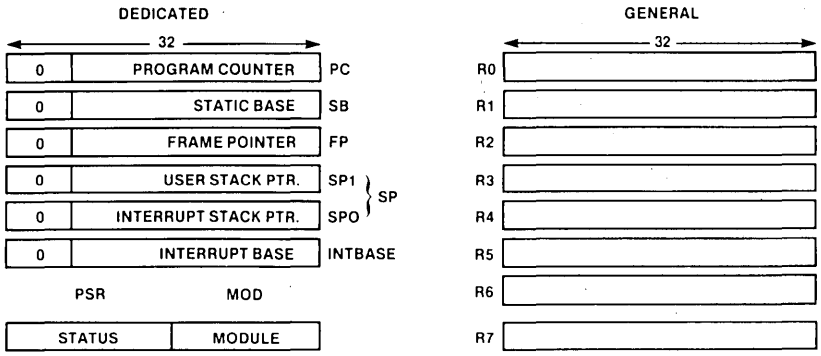

Table 1 F16032 Instruction Summary

Mnemonic	Meaning
ABS	Absolute Value
ACB	Add Compare and Branch
ADD	Add
ADDC	Add with Carry
ADDP	Add Packed Decimal
ADDQ	Add Quick Integer
ADDR	Calculate Address
ADJSP	Adjust Stack Pointer
AND	And
ASH	Arithmetic Shift
B	Conditional Branch
BIC	Bit Clear
BICPSR	Bit Clear in PSR
BISPSR	Bit Set in PSR
BPT	Breakpoint Trap
BSR	Branch to Subroutine
CASE	Case Branch
CBIT	Clear Bit
CHECK	Check Index
CMP	Compare
CMPM	Compare Multiple
CMPQ	Compare Quick Integer
CMPS	Compare String
COM	Complement
CVTP	Convert to Bit Pointer
CXP	Call External Procedure
CXPD	Call External Procedure with Descriptor
DFI	Divide Extended Integer
DIV	Divide
ENTER	Enter New Context
EXIT	Exit Context
EXT	Extract Field
EXTS	Extract Field Short
FFS	Find First Set Bit
FLAG	Flag Trap
IBIT	Invert Bit
INDEX	Calculate Index
INS	Insert Field
INSS	Insert Field Short
JSR	Jump to Subroutine
JUMP	Jump
LMR	Load MMU Register
LPR	Load Processor Register
LSH	Logical Shift
MEI	Multiply Extended Integer
MOD	Modulus of Periodic Function
MOV	Move
MOVM	Move Multiple
MOVQ	Move Quick Integer
MOVS	Move String
MOVSU	Mover Supervisor to User
MOVUS	Mover User to Supervisor
MOVX	Sign Extend
MOVZ	Zero Extend
MUL	Multiply

F16456
Multiple Protocol Communications Controller

Microprocessor Product

Description

The Fairchild F16456 Multiple Protocol Communications Controller (MPCC) is a programmable microprocessor peripheral device that interfaces a computer system to a serial data communication channel with minimum system overhead. It can be used in computer-to-computer or computer-to-terminal communications, or in control of network trunk lines with the F16000 family and other microprocessors.

- **F16000 Family, 8080, 8086 Bus Compatible**
- **Satisfies Interface Requirements for Asynchronous Mode and for Synchronous Bit-Oriented Protocol (BOP) or Synchronous Byte-Control Protocol (BCP)**
- **Generates and Tests Error Detection Codes; Generates and Detects Special Characters**
- **Bidirectional Three-State Data Bus Interface (Selectable as 8-Bit or 16-Bit Bus)**
- **Full- or Half-Duplex Operation**
- **Modem Handshake Signals**
- **5- to 8-Bit Character Lengths**
- **Primary or Secondary Station Operation**
- **Normal and Transparent Text Modes**
- **Directly Addressable Registers**
- **Serial Data from dc to 2.0M bps**
- **NRZ or NRZI (Complemented on Zero) Serial Data**
- **Self-Tested Loop-Back Mode**
- **Maintains Data Transparency Through Automatic Manipulation of the Data Stream**
- **TTL-Compatible**
- **Single +5 V Power Supply**
- **40-Pin Plastic or Ceramic Dual-in-Line Package**

The F16456 MPCC is functionally divided into a serial data receiver, serial data transmitter, addressable registers, and data bus control logic. The receiver and transmitter operate at independent rates determined by their clocks. The eight registers contained in the MPCC are directly addressable when using an 8-bit data bus; they are addressed in pairs when a 16-bit data bus is used. The MPCC is manufactured using high-speed XMOS technology.

F16488
GPIB Controller

Microprocessor Product

Description

The Fairchild F16488 General-Purpose Interface Bus (GPIB) controller serves as a general IEEE-488 compatible listener/talker and controller within the 16000 microprocessor family for applications in the interconnection of intelligent programmable instruments on the general-purpose interface bus. It is compatible with most MOS microprocessor families.

- **Handles All IEEE 488-1975/78 as Well as 1980 Supplement Functions**
- **Talker, Listener, and Controller Functions**
- **Compliance of All Bus Signals with IEEE 488 and IEC 625 Inputs, Threshold, Termination, and Output Specifications**
- **DMA Access Facilities (Compatible with F16203 and Most Other DMA Controllers)**
- **Single-Phase 10-MHz Maximum TTL Clock**
- **Pass Control Capabilities**
- **Stoppage of Transmission of Unwanted Data Possible Through NBAF Auxiliary Command**
- **On-Board Drivers**
- **Hold-Off on All Data and Hold-Off on Command**
- **End-of-String Recognition by EOS Byte or EOI Pin**
- **Programmable Counter for T1**
- **40-Pin Package**
- **Single 5 V + 10% Power Supply**
- **One-MHz Data Transfer Rate**

MBL8086

16-BIT GENERAL PURPOSE MICROPROCESSOR

GENERAL DESCRIPTION

The MBL8086 is a new high performance microprocessor fabricated using N-channel, depletion load, silicon gate technology and packaged in a 40-pin package. The processor has attributes of both 8-and 16-bit microprocessors. It addresses memory as a sequence of 8-bit bytes, but has a 16-bit wide physical path to memory for high performance.

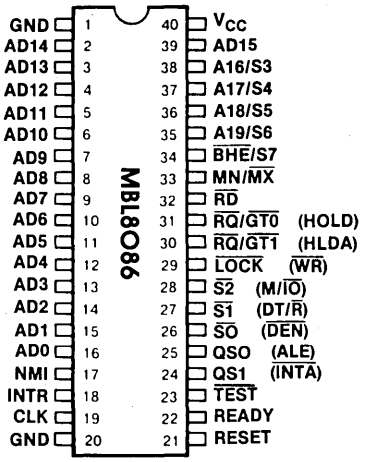
The MBL8086 is compatible with Intel 8086 microprocessor and will be supported with several peripheral devices, including the MBL8089 I/O processor device during 1982.

FEATURES

- Assembly language compatible with 8080/8085 microprocessors
- Bit, byte, word and block operations
- 24 Operand Addressing Modes
- 8-and 16-bit signed and unsigned arithmetic in binary or decimal, including multiply and divide
- 5 MHz Clock Rate
- 14 word, by 16-bit Register Set with Symmetrical Operations

MBL8086

PIN ASSIGNMENT



- Compatible with Intel 8086

MB8840/MB88400 Series
MB8850/MB88500 Series
MB88200 Series

SINGLE COMPONENT 4-BIT MICROCOMPUTER SERIES

GENERAL DESCRIPTION

This 4-bit series, available in both CMOS and NMOS, provides the user with a common architecture, instruction set and speed regardless of which device in the family is selected. As shown, various combinations of options are available so that a processor can specifically be tailored to an application and thereby be cost effective. On-board timers, LCD driver, A/D or D/A converter and power down options are available. To facilitate prototype development, devices with piggyback EPROMS are available for each subseries.

Devices are provided in standard DIP, skinny DIP (70 mil pin spacing) or flatpack.

FEATURES

- Various RAM and ROM levels available
- 57 I/O lines maximum
- 3 μS Instruction Cycle Time at 2 MHz clock rate
- TTL/CMOS compatible I/O level
- 70 powerful instructions for NMOS version
- 72 powerful instructions including power saving HALT and STOP modes for CMOS version

FUJITSU
MICROELECTRONICS
CMOS SINGLE CHIP 8-BIT MICROCOMPUTER

MBL80C49
MBL80C39

GENERAL DESCRIPTION

The Fujitsu MBL80C49/MB80C39 is a totally self-contained 8-bit single-chip microcomputer fabricated with silicon-gate CMOS technology. The MBL80C49 has a 2K x 8 ROM program memory, a 128 x 8 RAM data memory, 27 I/O ports, an 8-bit timer/counter, and clock generator on chip. The MBL80C39 is identical to the MBL80C49 except without program memory. It can be used with external memory for system prototyping and pre-production systems.

The design is optimized for low cost and high performance applications because the MBL80C49/ MB80C39 is fabricated on a single silicon chip and can be used for applications that require additional expansion of ROM, RAM, I/O ports, etc.

This microcomputer permits external program operation and single-step operation. Low power applications are possible by using the stand-by mode feature. The software is upward compatible with the MBL8049/ MBL8039 and Intel i8049/i8039.

The MBL80C49/MB80C39 uses a single power supply of +5V. It is packaged in a standard 40-pin DIP and operation is guaranteed over the range of −40°C to +85°C.

FEATURES

- **12-bit Addressing**
- **98 Instructions (232 Instruction Codes): 70% of Instructions are Single Byte**
- **2.5μs Instruction Cycle: All Instructions are 1 or 2 Cycles**
- **On-chip Clock Generator (or External Clock Source)**
- **2K x bit ROM**
- **128 x 8 bit RAM**
- **27 I/O Lines**
- **8-bit Interval Timer/Event Counter**
- **8-Level Stack**
- **8 pairs of Working Registers**
- **Low-power Standby Mode Capability by HALT and STOP Instructions**
- **External Program Mode Capability**
- **Single-step Operation Capability**
- **Easily Expandable Memory and I/O**
- **Single-level Interrupt Capability**
- **ALU Functions: Addition, Decimal Adjust Addition, and Logic Operations**

Device Number	Description	Max. Freq.	Power Supply (V)	Power Dissipation (mW Max.)	I/O Level	Package

NMOS SINGLE CHIP MICROCOMPUTER

MBL8051
MBL8031

GENERAL DESCRIPTION

The Fujitsu MBL8051/MBL8031 is a totally self-contained, high performance single-chip microcomputer fabricated with silicon gate NMOS technology. It provides the hardware features, architectural enhancements and new instructions that are necessary to make it a powerful and cost effective controller for applications requiring up to 64K bytes of program memory and/or up to 64K bytes of data storage.

The MBL8051/MBL8031 is efficient both as a controller and as a arithmetic processor with extensive facilities for binary and BCD arithmetic along with bit-handling capabilities. Efficient use of program memory results from an instruction set consisting of 44% one-byte, 41% two-byte, and 15% three-byte instructions. With a 12 MHz crystal, 58% of the instructions execute in 1.0μS, 40% in 2.0μS and multiply and divide require only 4.0μS.

FEATURES

- **4K x 8 ROM**
- **128 x 8 RAM**
- **Four 8-Bit Ports, 32 I/O Lines**
- **Two 16-Bit Timer/Event Counters**
- **High Performance Full-Duplex Serial Channel**
- **External Memory Expandable to 128K**
- **Boolean Processor**
- **MBL8048 Architecture Enhanced with:**
  - **Non-paged Jumps**
  - **Direct Addressing**
  - **Four 8-Register Banks**
  - **Stack Depth up to 128-Bytes**
  - **Multiply, Divide, Add, Subtract, Compare**
- **Most Instructions Execute in 1μS**
- **4μS Multiply and Divide**

FUJITSU MICROELECTRONICS

MB8876A MB8877A

FLOPPY DISK FORMATTER/CONTROLLER (FDC)

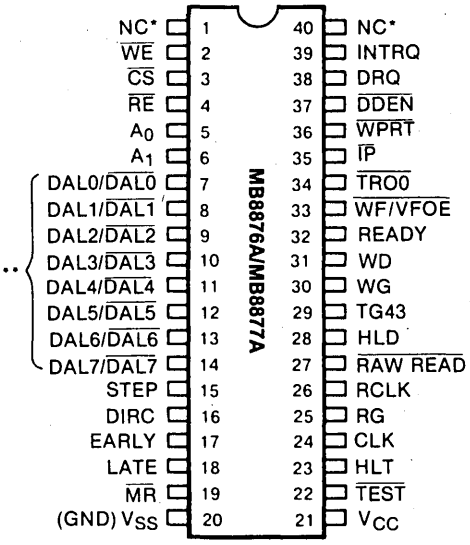
DESCRIPTION

The Fujitsu MB8876A and MB8877A are one-chip Floppy Disk Formatter/Controllers (FDC) which are fabricated with N-channel E/D MOS technology. They can be applied to any single density floppy disk, double density floppy disk and mini floppy disk.

The IBM3740 format and the frequency modulation (FM) recording are used for the single density storage, and the IBM System-34 format and the modified frequency modulation (MFM) recording are used for the double density storage.

The MB8867A and MB8877A interface with an 8-bit parallel microprocessor to control data transfer and mechanical operation. They are packaged in a standard 40-pin dual in-line package.

PIN ASSIGNMENT



FEATURES

- **Interface to 8-bit Microprocessor**
  - **MB8876A: Negative-logic 8-bit Data Bus**
  - **MB8877A: Positive-logic 8-bit Data Bus**
- **Single +5V Power Supply**
- **IBM Compatible Sector Format**
- **Automatic Track Seeking and Verification**
- **Both Single and Double Density Formats**
  - **a) Single Density in IBM3740 Format and FM Recording**
  - **b) Double Density in IBM System-34 Format and MFM Recording**
- **Programmable Single Sector/ Multiple Sectors/Entire Track Read Operation**
- **Programmable Single Sector/ Multiple Sectors/Entire Track Write Operation**
- **Programmable Side Compare Function**
- **Programmable Sector Length**
- **Programmable Head Step Rate**
- **Programmable Head Engage/Head Settle Time**
- **Double Buffered Data I/O**
- **DMA Data Transfer Capability**
- **Write Precompensation Capability**
- **All TTL Compatible I/O**
- **N-Channel E/D MOS Technology**
- **MB8876A Upward Compatible with Western Digital FD19971-02**
- **MB8877A Upward Compatible with Western Digital FD1793-02**

For complete data sheets contact: Fujitsu Microelectronics • 2985 Kifer Road • Santa Clara, CA 95051 • (408) 727-1700 • Telex I/II: 910-338-0190

8 Bit Microcomputer

FEATURES

- 1024 x 13-bit Program ROM
- 64 x 8-bit RAM (16 special purpose registers)
- Arithmetic Logic Unit
- Sophisticated interrupt structure
- 6 level pushdown stack
- Versatile self contained oscillator
- 2.0μs instruction execution time
- Wide power supply operating range (4.5-5.5 volts)
- 4 sets of 8 user defined TTL compatible I/O lines
- Available in two temperature ranges: 0°C to 70°C and −40°C to 85°C.

DESCRIPTION

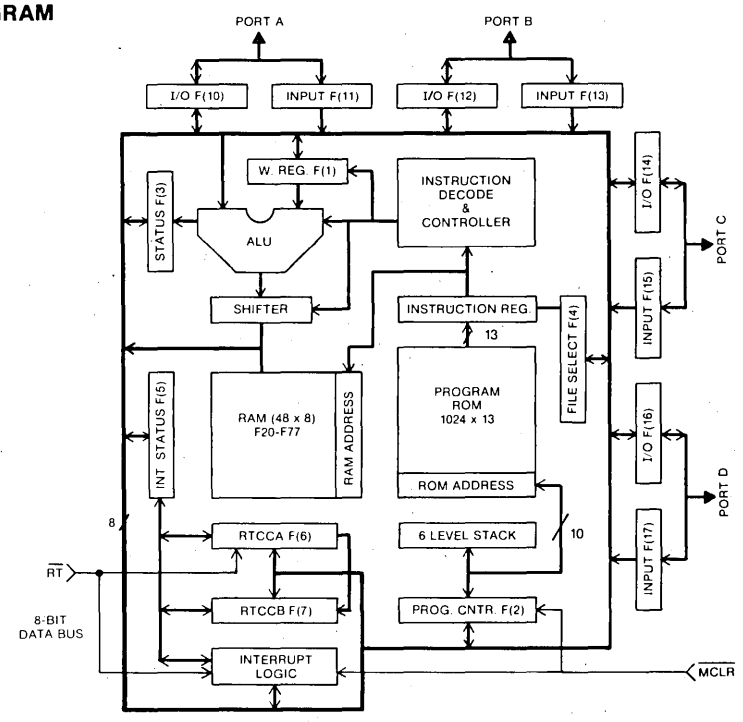
The PIC1670 microcomputer is an MOS/LSI device containing RAM, I/O, and a central processing unit as well as customer-defined ROM on a single chip. This combination produces a low cost solution for applications which require sensing individual inputs and controlling individual outputs. Keyboard scanning, display driving, and system control functions can be done at the same time due to the power of the 8-bit CPU.

The internal ROM contains a customer-defined program using the PIC's powerful instruction set to specify the overall functional characteristics of the device. The 8-bit input/output registers provide latched lines for interfacing to a limitless variety of applications. The PIC can be used to scan keyboards, drive displays, control electronic games and provide enhanced capabilities to vending machines, traffic lights, radios, television, consumer appliances, industrial timing and control applications. The 13-bit instruction word format provides a powerful yet easy to use instruction repertoire emphasizing single bit manipulation as well as logical and arithmetic operations using bytes.

The PIC1670 is fabricated with N-Channel Silicon Gate technology resulting in a high performance product. Only a single wide range power supply is required for operation. An on-chip oscillator provides the operating clock with either an external crystal or RC network to establish the frequency. Inputs and outputs are TTL-compatible, with open-drain option available.

Extensive hardware and software support is available to aid the user in developing an application program and to verify performance before committing to mask tooling. Programs can be assembled into machine language using PICAL, eliminating the burden of coding with ones and zeros. PICAL is available in a Fortran IV version that can be run on many popular computer systems. Once the application program is developed several options are available to insure proper performance. The PIC's operation can be verified in any hardware application by using the PIC1665. The PIC1665 is a ROM-less PIC1670 microcomputer with additional pins to connect external PROM or RAM and to accept HALT commands. The PFD 1020 Field Demo System is available containing a PIC1665 with sockets for erasable PROMs. Finally, the PICES II (PIC In-Circuit Emulation System) provides the user with emulation and debugging capability in either a stand-alone mode or operation as a peripheral to a larger computer system. Easy program debugging and changing is facilitated because the user's program is stored in RAM. With these development tools, the user can quickly and confidently order the masking of the PIC's ROM and bring his application into the market.

PIC1670 BLOCK DIAGRAM



© IC MASTER 1983

ARCHITECTURAL DESCRIPTION

The firmware architecture of the PIC1670 microcomputer is based on a register file concept with simple yet powerful instruction commands designed to optimize the code for bit, byte, and register transfer operations. The instruction set also supports computing functions as well as these control and interface functions.

Internally, the functional blocks of the PIC1670 are connected by an 8-bit bidirectional bus: the 64 8-bit registers of which the first 16 are special purpose, an Arithmetic Logic Unit, and a user defined program ROM composed of 1024 x 13 words. The register file is divided into two functional groups: operational registers and general purpose registers. The first sixteen are the operational registers and they include the Real Time Clock Counter A and B, four I/O registers, two Status registers, a Program Counter and a File Select Register. The general purpose registers are used for data and control information under command of the instructions.

The Arithmetic Logic Unit contains one temporary working register (W Register), an adder, and hardware for decimal adjust. Manipulation between data in the working register and any other register can be performed.

The Program ROM contains the user defined application program and is supported by an instruction decoder and instruction register. Sequencing of microinstructions is controlled via the Program Counter (PC) which automatically increments to execute in-line programs. The Program Counter is modified by bit test, jump, call or branch instructions and the lower 8-bits can be modified for computed addresses by file register instructions. In addition, an on-chip six level stack is employed to push and pull the contents of the program counter. This provides easy to use subroutine nesting. Activating the MCLR input on power-up initializes the ROM program to address 1777_8.

PIN FUNCTIONS

Signal	Function
OSC1 (Input), OSC2 (output)	Oscillator pins. The on-board oscillator can be driven by an external crystal, ceramic resonator or LC network, or an external clock via these pins.
$\overline{RT}$ (Input)	Real Time Input. Negative transitions on this pin increment the RTCC (F6) register. This pin can also be used for an interrupt input. This pin uses a Schmitt trigger input. There is no internal active pull-up device.
RA0-7, RB0-7, RC0-7, RD0-7	User programmable input/output lines. These lines can be used as inputs and/or outputs and are under direct control of the program.
$\overline{MCLR}$ (Input)	Master Clear. Used to initialize the internal ROM program to address 1777_8, latch all I/O registers high, and disables the interrupts. This pin uses a Schmitt trigger input. There is no internal active pull-up device.
TEST	Test pin. This pin is used for testing purposes only. It must be grounded for normal operation.
V_{DD}	Power supply pin.
V_{SS}	Ground pin.
CLKOUT	Clock Output. A signal derived from the internal oscillator. May be used by external circuitry to synchronize with PIC1670 timing.

REGISTER FILE ARRANGEMENT

File (Octal)	Function
F0	Not a physical register. F0 calls for contents of the FSR (F4) to be used to select a file register. F4 is used as an indirect address pointer.
F1	W Register — The working register.
F2	Program Counter — Points to the next program ROM address to be executed.
F3	Arithmetic Status Register 7 6 5 4 3 2 1 0 0 X A9 A8 OV Z DC C Bit 0 (C) — Bit 0 is the carry flag, and is usually the carry from the A.L.U., also used as a borrow in subtract instructions. Bit 1 (DC) — Bit 1 is the half carry (decimal carry) and is used to indicate a carry from bit 3 in the A.L.U. as the result of an addition (byte). This bit is used in the decimal adjust instruction to allow B.C.D. decimal addition. Bit 2 (Z) — Bit 2 is the zero flag and is set to a one if the results of the previous operation was identically zero. Bit 3 (OV) — Bit 3 is the overflow flag, and is set to a one by operations which cause a signed two's complement arithmetic overflow. The bit is set when the carry from the MSB in the A.L.U. is opposite to the carry from the MSB-1 bit. Bit 4 (A8) — Bit 4 is the 9th bit of the program counter. This bit is a read only bit. Bit 5 (A9) — Bit 5 is the 10th bit of the program counter. This bit is a read only bit.
F4	File Select Register — The FSR is used in generating effective file register addresses under program control.
F5	Interrupt Status Register X CNTE A/B CNTS RTCIR XIR RTCIE XIE — Used to control interrupts and registers F6 and F7.
F6,F7	RTCCA and RTCCB — Real Time Clock Counters A & B respectively can be configured as a single 16 bit counter, an 8 bit counter and an 8 bit general purpose register, or two general purpose registers when no external counting is required. The RTCC registers can be loaded and read by the program, as well as count negative transitions on the $\overline{RT}$ pin or count at 1/8 the frequency of the oscillator. If data are being stored into RTCCA simultaneous with a negative transition on the RT pin (and CNTE=1 and CNTS=1), RTCCA will contain the new stored value and the external transition will be ignored by the microcomputer. (See the section "Real Time Clock Interrupt" for further details about the RTCC.)
F10,11	I/O Port A
F12,13	I/O Port B
F14,15	I/O Port C
F16,17	I/O Port D
F20,77	General Purpose Registers—Used for temporary and general purpose storage during program execution time.

NOTE: F10, 12, 14 & 16 are the I/O registers and F11, 13, 15 & 17 are used for reading the actual pin levels.

Basic Instruction Set Summary

Each PIC instruction is a 13-bit word divided into an OP code which specifies the instruction type and one or more operands which further specify the operation of the instruction. The following PIC instruction summary lists byte-oriented, bit-oriented, and literal and control operations.

For byte-oriented instructions, "f" represents a file register designator and "d" represents a destination designator. The file register designator specifies which one of the PIC file registers is to be utilized by the instruction. The destination designator specifies where the result of the operation performed by the instruction is to be placed. If "d" is zero, the result is placed in the PIC W register. If "d" is one, the result is returned to the file register specified in the instruction.

For bit-oriented instructions, "b" represents a bit field designator which selects the number of the bit affected by the operation, while "f" represents the number of the file in which the bit is located.

For literal and control operations, "k" represents an eight or nine bit constant or literal value.

For an oscillator frequency of 4MHz the instruction execution time is 2.0 μsec unless a conditional test is true or the program counter is changed as a result of an instruction. In these two cases, the instruction execution time is 4.0 μsec.

NOTE:
DAW: Decimal Adjust W.
This instruction adjusts the eight bit number in the W register to form two valid BCD (binary coded decimal) digits, one in the lower and one in the upper nibble. (The results will only be meaningful if the number in W to be adjusted is the result of adding together two valid two digit BCD numbers.)

The adjustment obeys the following two step algorithm:
1. If the lower nibble is greater than 9 or the digit carry flag (DC) is set, 06 is added to the W register.
2. Then, if the upper nibble is greater than 9 or the carry from the original or step 1 addition is set, 60 is added to the W register. The carry bit is set if there is a carry from the original, step 1 or step 2 addition.

© IC MASTER 1983

INTERRUPT SYSTEM

The interrupt system of the PIC1670 is comprised of an external interrupt and a real-time clock counter interrupt. These have different interrupt vectors, enable bits and status bits. Both interrupts are controlled by the status register (F5)** shown below.

NOT USED	CNTE	A/B	CNTS	RTCIR	XIR	RTCIE	XIE
7*	6	5	4	3	2	1	0

*Bit 7 is unused and is read as zero.

**Register 5 will power up to all zeroes.

EXTERNAL INTERRUPT

On any high to low transition of the $\overline{RT}$ pin the external interrupt request (XIR) bit will be set. This request will be serviced if the external interrupt enable (XIE) bit is set or if it is set at a later point in the program. The latter allows the processor to store a request (without interrupting) while a critical timing routine is being executed. Once external interrupt service is initiated, the processor will clear the XIR bit, delay one cycle (to execute the current instruction), then push the current program counter onto the stack and execute the instruction at location 1760_8. It takes three to four instruction cycles from the transition on the $\overline{RT}$ pin until the instruction at 1760_8 is executed. No new interrupts can be serviced until a return from interrupt (RETFI) instruction has been executed.

REAL-TIME CLOCK INTERRUPT

The real-time clock counter (RTCCA & RTCCB, file registers F6 and F7) have a similar mechanism of interrupt service. The RTCCA register will increment if the count enable (CNTE) bit is set. If this bit is not set the RTCCA & RTCCB will maintain their present contents and can therefore be used as general purpose RAM registers. The count source (CNTS) bit selects the clocking source for RTCCA. If CNTS is cleared to a '0', then RTCCA will use the internal instruction clock and increment at 1/8 the frequency present on the OSC pins. If CNTS is set to a '1', then RTCCA will increment on each high to low transition of the RT pin. RTCCB can only be incremented when RTCCA makes a transition from 377_8 to 0 and the A/B status bit is set. This condition links the two eight bit registers together to form one sixteen bit counter. An interrupt request under these conditions will occur when the combined registers make a transition from 177777_8 to 0. If, however, the A/B bit is not set, then RTCCA will be the only incrementing register and an interrupt request will occur when RTCCA makes a transition from 377_8 to 0. (In this setup the RTCCB register will not increment and can be used as a general purpose RAM register.) Once a request has come from the real-time clock counter, the real-time clock interrupt request (RTCIR) bit will be set. At this point, the request can either be serviced immediately if the real-time clock interrupt enable (RTCIE) bit is set or be stored if RTCIE is not set. The latter allows the processor to store a real-time clock interrupt while a critical timing routine is being executed. Once interrupt service is initiated, the processor will clear the RTCIR bit, delay one cycle (to execute the current instruction), then push the present program counter onto the stack and execute the instruction at location 1740_8 It takes three instruction cycles from when the RTCC (A or B) overflows until the instruction of 1740 is executed. No new interrupts can be serviced until a RETFI instruction has been executed.

The RETFI instruction (00002_8) must be used to return from any interrupt service routine if any pending interrupts are to be serviced. External interrupts have priority over RTCC driven interrupt in the event both types occur simultaneously. Interrupts cannot be nested but will be serviced sequentially. The existence of any pending interrupts can be tested via the state of the XIR (bit 2) and RTCIR (bit 3) in the status word F5.

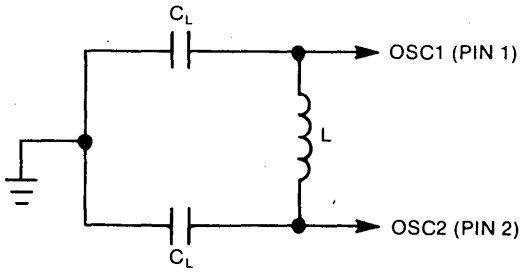
PIC1670 OSCILLATOR OPTIONS (TYPICAL CIRCUIT)

LC OPERATION

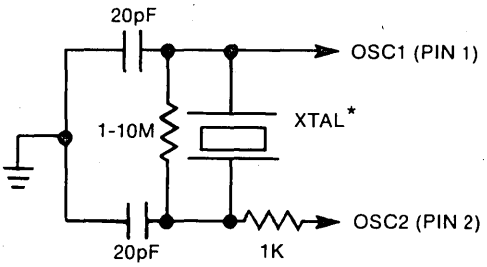


$$f_{OSC} \approx \frac{1}{2\pi\sqrt{L\,(C_L + C_{INT})}},$$

where $C_{INT} = 10pF$.

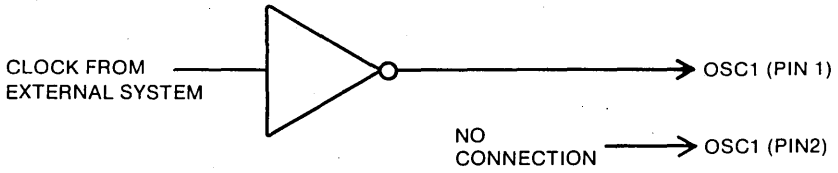
Typical values for 4MHz operation:
$L = 70\mu H$
$C_L = 10pF$

CRYSTAL INPUT OPERATION

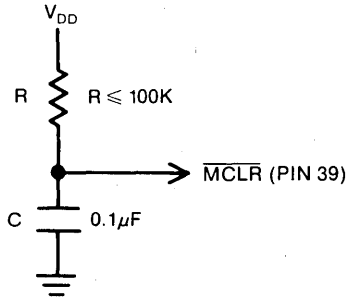


*or ceramic resonator, parallel resonant (0.8 - 5.0MHz)

EXTERNAL CLOCK INPUT OPERATION



MASTER CLEAR (TYPICAL CIRCUIT)



Master Clear requires 10ms delay (assuming a 4MHz crystal) before activation after power is applied to the V_{DD} pin, for the crystal to start up. To achieve this, an external RC configuration as shown can be used (assuming V_{DD} is applied as a step function).

ELECTRICAL CHARACTERISTICS

Maximum Ratings*

Ambient Temperature Under Bias .....−40°C to +85°C
Storage Temperature .....−55°C to +150°C
Voltage on any Pin with Respect to V_{SS} ..... −0.3V to +10.0V
Power Dissipation 1000mW

*Exceeding these ratings could cause permanent damage to the device. This is a stress rating only and functional operation of this device at these conditions is not implied—operating ranges are specified in Standard Conditions. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Data labeled "typical" is presented for design guidance only and is not guaranteed.

Standard Conditions (unless otherwise stated):

DC CHARACTERISTICS

Operating Temperature T_A = 0°C to +70°C

Characteristic	Sym	Min	Typ†	Max	Units	Conditions
Primary Supply Voltage	V_{DD}	4.5	—	5.5	V	
Primary Supply Current	I_{DD}	—	—	100	mA	All I/O pins high
Input Low Voltage (except $\overline{MCLR}$ & $\overline{RT}$)	V_{IL}	−0.2	—	0.8	V	
Input High Voltage (except $\overline{MCLR}$, $\overline{RT}$, OSC1)	V_{IH1}	2.4	—	V_{DD}	V	
Input High Voltage ($\overline{MCLR}$, $\overline{RT}$ OSC1)	V_{IH2}	V_{DD}−1	—	V_{DD}	V	
Output High Voltage	V_{OH}	2.4	—	V_{DD}	V	I_{OH} = −100μA provided by internal pullups (Note 2)
Output Low Voltage (I/O and CLK OUT)	V_{OL}	—	—	0.45	V	I_{OL} = 1.6mA
Input Leakage Current ($\overline{MCLR}$, $\overline{RT}$,OSC1)	I_{LC}	−5	—	+5	μA	$V_{SS} \leq V_{IN} \leq V_{DD}$
Input Low Current (all I/O ports)	I_{IL}	−0.2	−0.6	−2.0	mA	V_{IL} = 0.4V, internal pullup
Input High Current (all I/O ports)	I_{IH}	−0.1	−0.4	—	mA	V_{IH} = 2.4V

†Typical data is at T_A = 25°C, V_{DD} = 5.0V.

NOTES:
1. Total power dissipation for the package is calculated as follows:
   $P_D = (V_{DD})(I_{DD}) + \Sigma (V_{DD} - V_{IL})(|I_{IL}|) + \Sigma (V_{DD} - V_{OH})(|I_{OH}|) + \Sigma (V_{OL})(I_{OL})$.
2. Positive current indicates current into pin. Negative current indicates current out of pin.
3. Total I_{OL} for all output pin (I/O ports plus CLK OUT) must not exceed 175mA.

Standard Conditions (unless otherwise stated):

AC CHARACTERISTICS

Operating Temperature T_A = 0°C to +70°C

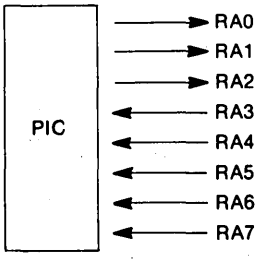
Characteristic	Sym	Min	Typ	Max	Units	Conditions
Instruction Cycle Time	t_{cy}	2.0	—	8	μs	4MHz — 1MHz external time base (Note 1)
$\overline{RT}$ Input						(Note 2)
Period	t_{RT}	t_{cy}	—	—	—	
High Pulse Width	t_{RTH}	½t_{cy}	—	—	—	
Low Pulse Width	t_{RTL}	½t_{cy}	—	—	—	
I/O Ports						
Data Input Setup Time	t_s	—	—	¼t_{cy}−125	ns	
Data Input Hold Time	t_h	0	—	—	ns	
Data Output Propagation Delay	t_{pd}	—	500	800	ns	Capacitive load = 50pF

NOTES:
1. Instruction cycle period (t_{CY}) equals eight times the input oscillator time base period.
2. Due to the synchronous timing nature between CLK OUT and the sampling circuit used on the $\overline{RT}$ input, CLK OUT may be directly tied to the $\overline{RT}$ input. The minimum times specified represent theoretical limits.

© IC MASTER 1983

INPUT/OUTPUT CAPABILITY

The PIC1670 provides four complete quasi-bidirectional input/output ports. A simplified schematic of an I/O pin is shown below. The ports occupy address locations in the register file space of the PIC1670. Thus, any instruction that can operate on a general purpose register can operate on an I/O port. Two locations in the register file space are allocated for each I/O port. Port RA0-7 is addressable as either F10 or F11. Port RB0-7 is addressable as either F12 or F13. Port RC0-7 is addressable as either F14 or F15 and Port RD0-7 is addressable as either F16 or F17. AnI/O port READ on its odd-numbered location will interrogate the chip pins while an I/O port READ on its even-numbered location will interrogate the internal latch in that I/O port. This simplifies programming in cases where a portion of a single port is used for inputting only, while the remainder is used for outputing as illustrated in the following example.



Here, the low 3 bits of port RA are used as output-only, while the high 5 bits are used as input-only. During power on reset ($\overline{MCLR}$ low), the latches in the I/O ports will be set high, turning off all pull down transistors as represented by Q_2 in Figure 1. During program execution if we wish to interrogate an input pin, then, for example,

```
BTFSS 11,6
```

will test pin RA6 and skip the next instruction if that pin is set. If we wish to modify a single output, then, for example,

```
BCF 10,2
```

will force RA2 to zero because its internal latch will be cleared to zero. This will turn on Q_2 and pull the pin to zero.

The way this instruction operates internally is the CPU reads file 10 into the A.L.U., modifies the bit and re-outputs the data to file 10. If the pins were read instead, any input which was grounded externally would cause a zero to be read on that bit. When the CPU re-outputted the data to the file, that bit would be cleared to zero, no longer useful as an input until set high again.

During program execution, the latches in bits 3-7 should remain in the high state. This will keep Q_2 off, allowing external circuitry full control of pins RA3-RA7, which are being used here as input.

BIDIRECTIONAL INPUT-OUTPUT PORT

Narrator™ Speech Processor

FEATURES

- Natural Speech
- Stand Alone Operation with Inexpensive Support Components
- Wide Operating Voltage
- Word, Phrase, or Sentence Library, ROM Expandable
- Expandable to 491K of ROM Directly
- Simple Interface to Most Microcomputers or Microprocessors
- Supports L.P.C. Synthesis: Formant Synthesis: Allophone Synthesis

GENERAL DESCRIPTION

The SP0256 (Speech Processor) is a single chip N-Channel MOS LSI device that is able, using its stored program, to synthesize speech or complex sounds.

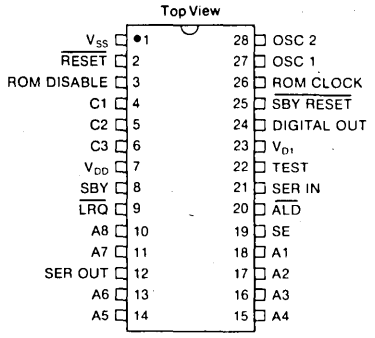
The achievable output is equivalent to a flat frequency response ranging from 0 to 5KHz, a dynamic range of 42dB, and a signal to noise ratio of approximately 35dB.

The SP0256 incorporates four basic functions:

- A software programmable digital filter that can be made to model a VOCAL TRACT.
- A 16K ROM which stores both data and instructions (THE PROGRAM).
- A MICROCONTROLLER which controls the data flow from the ROM to the digital filter, the assembly of the "word strings" necessary for linking speech elements together, and the amplitude and pitch information to excite the digital filter.
- A PULSE WIDTH MODULATOR that creates a digital output which is converted to an analog signal when filtered by an external low pass filter.

PIN CONFIGURATION

28 LEAD DUAL IN LINE



APPLICATIONS

- Telecommunications
- Appliances
- Computer Peripherals
- Automotive
- Personal Computers
- Toys/Games
- Educational Aids
- Warning Systems
- Security Systems
- Electronic Musical Instruments
- Aids to the Blind
- Narrow Bandwidth
- Communication Systems

ELECTRICAL CHARACTERISTICS

Maximum Ratings*

V_{D1}, V_{DD} ..... −0.3V to +12V
Storage Temperature ..... −25°C to +125°C

Clock

Crystal Frequency 3.12MHz

*Exceeding these ratings could cause permanent damage to the device. This is a stress rating only and functional operation of this device at these conditions is not implied—operating ranges are specified in Standard Conditions. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Data labeled "typical" is presented for design guidance only and is not guaranteed.

DC CHARACTERISTICS

Operating Temperature T_A = 0°C to +70°C

Characteristics	Sym	Min	Typ	Max	Units	Conditions
Primary Supply Voltage	V_{DD}	4.6	—	7	V	
Standby Supply Voltage	V_{D1}	4.6	—	7	V	
Primary Supply Current	I_{DD}	—	—	90	mA	V_{D1}, V_{DD} = 7.0V, T_A = 25°C
Standby Supply Current	I_{D1}	—	—	21	mA	V_{SS} = 0.0V, T_A = 25°C
Inputs A1-A8, $\overline{ALD}$, SER IN, TEST, SE Logic 0	V_{IL}	0	—	0.6	V	
Logic 1	V_{IH}	2.4	—	V_{D1}	V	
Capacitance	C_{IN}	—	—	10	pf	
Leakage	I_{LC}	—	—	±10	μA	
$\overline{RESET}$, $\overline{SBY\ RESET}$ Logic 0	V_{IL1}	0	—	0.6	V	
Logic 1	V_{IH1}	3.6	—	V_{D1}	V

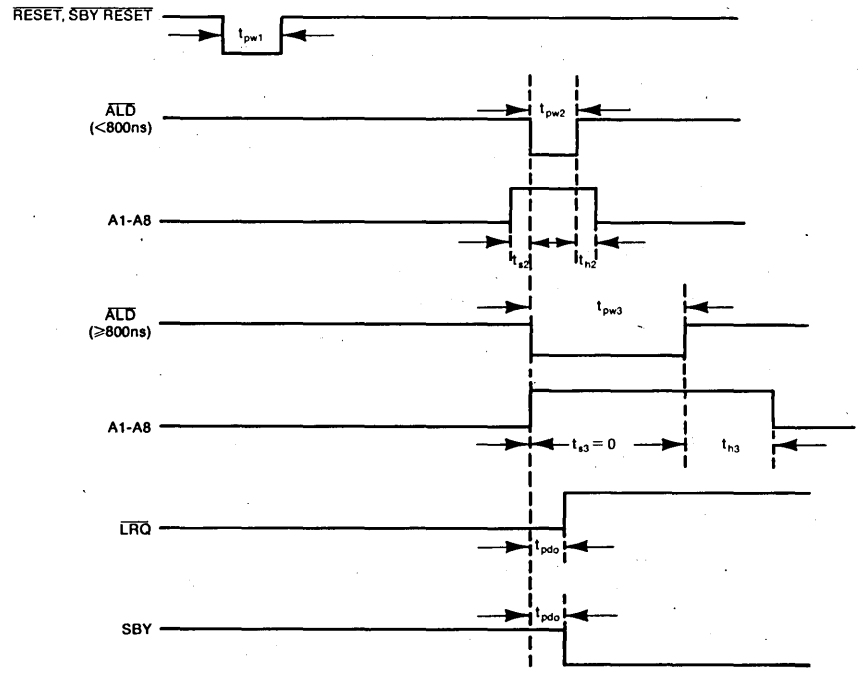

Fig. 1 TIMING DIAGRAM

PIN FUNCTIONS

Pin Number	Name	Function
1	V_{SS}	Ground
2	$\overline{\text{RESET}}$	A logic 0 resets the SP. Must be returned to a logic 1 for normal operation.
3	ROM DISABLE	For use with an external serial speech ROM. A logic 1 disables the external ROM.
4,5,6	C1,C2,C3	Output control lines used by an external serial speech ROM.
7	V_{DD}	Primary power supply.
8	SBY	STANDBY. A logic 1 output indicates that the SP is inactive (i.e., not talking) and V_{DD} can be powered down externally to conserve power. When the SP is reactivated by an address being loaded, SBY will go to a logic 0.
9	$\overline{\text{LRQ}}$	$\overline{\text{LOAD REQUEST}}$. $\overline{\text{LRQ}}$ is a logic 1 output whenever the input buffer is full. When $\overline{\text{LRQ}}$ goes to a logic 0, the input port is loaded by placing the 8 address bits on A1-A8 and pulsing the $\overline{\text{ALD}}$ input.
10,11,13,14, 15,16,17,18	A8,A7,A6,A5, A4,A3,A2,A1	8-bit address which defines any one of 256 speech entry points.
12	SER OUT	SERIAL ADDRESS OUT. This output transfers a 16-bit address serially to an external speech ROM.
19	SE	STROBE ENABLE. Normally held in a logic 1 state. When tied to ground, ALD is disabled and the SP will automatically latch in the address on the input bus approximately 1μs after detecting a logic 1 on any address line.
20	$\overline{\text{ALD}}$	$\overline{\text{ADDRESS LOAD}}$. A negative pulse on this input loads the 8 address bits into the input port. The leading edge of this pulse causes $\overline{\text{LRQ}}$ to go high.
21	SER IN	SERIAL IN. This is an 8-bit serial data input from an external speech ROM.
22	TEST	A logic 1 places the SP in test mode. This pin should normally be grounded.
23	V_{D1}	Standby power supply for the interface logic and controller.
24	DIGITAL OUT	Pulse width modulated digital speech output which, when filtered by a 5kHz low pass filter and amplified, will drive a loudspeaker.
25	$\overline{\text{SBY RESET}}$	$\overline{\text{STANDBY RESET}}$. A logic 0 resets the interface logic. Normally should be a logic 1.
26	ROM CLOCK	1.56MHz clock for an external serial speech ROM.
27	OSC 1	XTAL IN. Input connection for a 3.12MHz crystal.
28	OSC 2	XTAL OUT. Output connection for a 3.12MHz crystal.

GENERAL INSTRUMENT

SP0256-AL2

Allophone Based Speech Processor

DESCRIPTION

This product is the SP0256 Speech Processor preprogrammed with a standard ROM Pattern containing 64 allophones. Through the concatenation of selected allophones the user can construct any word in the English language, thereby providing an unlimited vocabulary at a data rate of less than 100 bits/second.

DATA MANUAL

A complete description of the SP0256-AL2 is contained in the Allophone Speech Synthesis Manual.

GENERAL INSTRUMENT

†SP0232

32K Speech Processor

DESCRIPTION

This product is pin for pin compatible with the SP0256 Speech Processor. This enhanced version of the SP0256 contains 32K of internal ROM.

†For future release.

GENERAL INSTRUMENT

SPR000

Speech Interface Chip

DESCRIPTION

The SPR000 is designed to interface a standard ROM, PROM, or EPROM to the SP0256 Speech Processor to provide a large amount of vocabulary expansion. This interface contains all the logic necessary to allow data communication under control of the Speech Processor. Two chip selects are provided, (CS1 and $\overline{CS2}$), for use in systems where it is desirable to bank blocks of memory under external control. With the capability of addressing 64K bytes of memory the SPR000 is ideal for applications such as SP0256 testing, and speech ROM emulation.

Programmable Sound Generator

FEATURES

- Full Software Control of Sound Generation
- Interfaces to Most 8-Bit and 16-Bit Microprocessors
- Three Independently Programmed Analog Outputs
- Two 8-Bit General Purpose I/O Ports (AY-3-8910)
- One 8-Bit General Purpose I/O Port (AY-3-8912)
- Single +5 Volt Supply

DESCRIPTION

The AY-3-8910/8912/8913 Programmable Sound Generator (PSG) is a LSI Circuit which can produce a wide variety of complex sounds under software control. The AY-3-8910/8912/8913 is manufactured in the General Instrument N-Channel Ion Implant Process. Operation requires a single +5V power supply, a TTL compatible clock, and a microprocessor controller such as the General Instrument 16-bit CP1610 or one of the PIC1650 series of 8-bit microcomputers.

The PSG is easily interfaced to any bus oriented system. Its flexibility makes it useful in applications such as music synthesis, sound effects generation, audible alarms, tone signalling and FSK modems. The analog sound outputs can each provide 4 bits of logarithmic digital to analog conversion, greatly enhancing the dynamic range of the sounds produced.

In order to perform sound effects while allowing the processor to continue its other tasks, the PSG can continue to produce sound after the initial commands have been given by the control processor. The fact that realistic sound production often involves more than one effect is satisfied by the three independently controllable channels available in the PSG.

All of the circuit control signals are digital in nature and intended to be provided directly by a microprocessor/microcomputer. This means that one PSG can produce the full range of required sounds with no change in external circuitry. Since the frequency response of the PSG ranges from sub-audible at its lowest frequency to post-audible at its highest frequency, there are few sounds which are beyond reproduction with only the simplest electrical connections.

Since most applications of a microprocessor/PSG system would also require interfacing between the outside world and the microprocessor, this facility has been designed into the PSG. The AY-3-8910 has two general purpose 8-bit I/O ports and is supplied in a 40 lead package: the AY-3-8912 has one port and 28 leads: the AY-3-8913 has no ports and 24 leads.

PIN FUNCTIONS

DA7--DA0 (input/output/high impedance): pins 30--37 (AY-3-8910)
Data/Address 7--0: pins 21--28 (AY-3-8912)
pins 4--11 (AY-3-8913)

These 8 lines comprise the 8-bit bidirectional bus used by the microprocessor to send both data and addresses to the PSG and to receive data from the PSG. In the data mode, DA7--DA0 correspond to Register Array bits B7--B0. In the address mode, DA3--DA0 select the register number ($0--17_8$) and a DA7--DA4 in conjunction with address inputs $\overline{A9}$ and A8 for the high order address (chip select).

A8 (input): pin 25 (AY-3-8910)
pin 17 (AY-3-8912)
pin 23 (AY-3-8913)

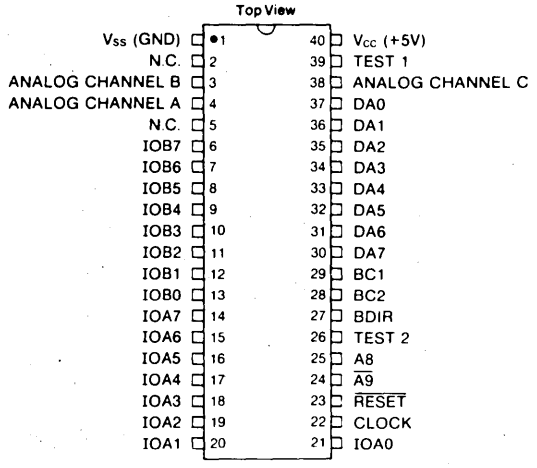
$\overline{A9}$ (input): pin 24 (AY-3-8910)
pin 22 (AY-3-8913)
(not provided on AY-3-8912)

Address 9, Address 8

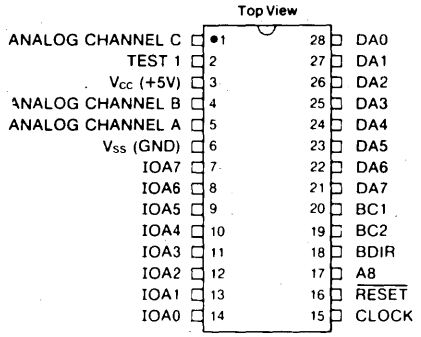
These "extra" address bits are made available to enable the positioning of the PSG (assigning a 16 word memory space) in a total 1,024 word memory area rather than in a 256 word memory area as defined by address bits DA7--DA0 alone. If the memory size does not require the use of these extra address lines they may be left unconnected as each is provided with either an on-chip pull down ($\overline{A9}$) or pull-up (A8) resistor. In "noisy" environments, however, it is recommended that $\overline{A9}$ and A8 be tied to an external ground and +5V, respectively, if they are not to be used.

PIN CONFIGURATIONS

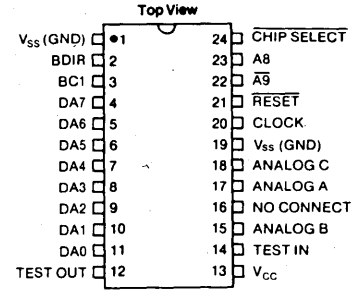
40 LEAD DUAL IN LINE
AY-3-8910



28 LEAD DUAL IN LINE
AY-3-8912



24 LEAD DUAL IN LINE



© IC MASTER 1983

RESET (input): pin 23 (AY-3-8910) pin 21 (AY-3-8913) pin 16 (AY-3-8912)

For initialization/power-on purposes, applying a logic "0" (ground) to the Reset pin will reset all registers to "0". The Reset pin is provided with an on-chip pull-up resistor.

CLOCK (input): pin 22 (AY-3-8910) pin 20 (AY-3-8913) pin 15 (AY-3-8912)

This TTL-compatible input supplies the timing reference for the Tone, Noise and Envelope Generators.

BDIR, BC2, BC1 (inputs): pins 27,28,29 (AY-3-8910) pins 18,19,20 (AY-3-8912) pins 2, 3 (No BC2 on AY-3-8913 see below).

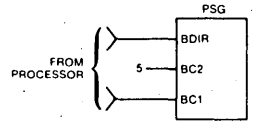
Bus DIRection, Bus Control 2,1

These bus control signals are generated directly by the CP1610 series of microprocessors to control all external and internal bus operations in the PSG. When using a processor other than the CP1610, these signals can be provided either by comparable bus signals or by simulating the signals on I/O lines of the processor. The PSG decodes these signals as illustrated in the following:

BDIR	BC2	BC1	CP1610 FUNCTION	PSG FUNCTION
0	0	0	NACT	INACTIVE. See 010 (IAB).
0	0	1	ADAR	LATCH ADDRESS. See 111 (INTAK).
0	1	0	IAB	INACTIVE. The PSG/CPU bus is inactive. DA7--DA0 are in a high impedance state.
0	1	1	DTB	READ FROM PSG. This signal causes the contents of the register which is currently addressed to appear on the PSG/CPU bus. DA7--DA0 are in the output mode.
1	0	0	BAR	LATCH ADDRESS. See 111 (INTAK).
1	0	1	DW	INACTIVE. See 010 (IAB).
1	1	0	DWS	WRITE TO PSG. This signal indicates that the bus contains register data which should be latched into the currently addressed register. DA7--DA0 are in the input mode.
1	1	1	INTAK	LATCH ADDRESS. This signal indicates that the bus contains a register address which should be latched in the PSG. DA7--DA0 are in the input mode.

While interfacing to a processor other than the CP1610 would simply require simulating the above decoding, the redundancies in the PSG functions vs. bus control signals can be used to advantage in that only four of the eight possible decoded bus functions are required by the PSG. This could simplify the programming of the bus control signals to the following, which would only require that the processor generate two bus control signals (BDIR and BC1, with BC2 tied to +5V). This is the case with the AY-3-8913 with BC2 pulled high internally.

BDIR	BC2	BC1	PSG FUNCTION
0	1	0	INACTIVE.
0	1	1	READ FROM PSG.
1	1	0	WRITE TO PSG.
1	1	1	LATCH ADDRESS.



ANALOG CHANNEL A, B, C (outputs): pins 4, 3, 38 (AY-3-8910) pins 5, 4, 1 (AY-3-8912) pins 17, 15, 18 (AY-3-8913)

Each of these signals is the output of its corresponding D/A Converter, and provides an up to 1V peak-peak signal representing the complex sound waveshape generated by the PSG.

IOA7--IOA0 (input/output): pins 14--21 (AY-3-8910) pins 7--14 (AY-3-8912) (not provided on AY-3-8913)

IOB7--IOB0 (input/output): pins 6--13 (AY-3-8910) (not provided on AY-3-8912) (not provided on AY-3-8913)

Input/Output A7--A0, B7--B0

Each of these two parallel input/output ports provides 8 bits of parallel data to/from the PSG/CPU bus from/to any external devices connected to the IOA or IOB pins. Each pin is provided with an on-chip pull-up resistor, so that when in the "input" mode, all pins will read normally high. Therefore, the recommended method for scanning external switches would be to ground the input bit.

TEST 1: pin 39 (AY-3-8910) pin 14 (AY-3-8913) pin 2 (AY-3-8912)
TEST 2: pin 26 (AY-3-8910) pin 12 (AY-3-8913) (not connected on AY-3-8912)

These pins are for General Instrument test purposes only and should be left open—do not use as tie-points.

V_{CC}: pin 40 (AY-3-8910) pin 13 (AY-3-8913) pin 3 (AY-3-8912)
Nominal +5Volt power supply to the PSG.

V_{SS}: pin 1 (AY-3-8910) pin 19 (AY-3-8913) pin 6 (AY-3-8912)
Ground reference for the PSG.

CHIP SELECT (Input) Pin 24 (AY-3-8913 only)

This input signal goes low to enable the PSG to read data on the data bus or write data from the data bus to one of the internal registers. For these above operations to occur, this signal must be true in addition to the current bus address being a valid PSG address. This signal must be valid for all read and write operations. The pin has an internal pull down to V_{SS}.

ARCHITECTURE

The AY-3-8910/8912/8913 is a register oriented Programmable Sound Generator (PSG). Communication between the processor and the PSG is based on the concept of memory-mapped I/O. Control commands are issued to the PSG by writing to 16 memory-mapped registers. Each of the 16 registers within the PSG is also readable so that the microprocessor can determine, as necessary, present states or stored data values.

All functions of the PSG are controlled through the 16 registers which once programmed, generate and sustain the sounds, thus freeing the system processor for other tasks.

REGISTER ARRAY

The principal element of the PSG is the array of 16 read/write control registers. These 16 registers look to the CPU as a block of memory and as such occupy a 16 word block out of 1,024 possible addresses. The 10 address bits (8 bits on the common data/address bus, and 2 separate address bits A8 and $\overline{A9}$) are decoded as follows:

* $\overline{A9}$	A8	DA7	DA6	DA5	DA4	DA3	DA2	DA1	DA0
0	1	0	0	0	0	0	0	0	0
THRU									
0	1	0	0	0	0	1	1	1	1
HIGH ORDER (Chip Select)						LOW ORDER (Register No.)			

* $\overline{A9}$ is not provided on the AY-3-8912.

The four low order address bits select one of the 16 registers (R0--$R17_8$). The six high order address bits function as "chip selects" to control the tri-state bidirectional buffers (when the high order address bits are "incorrect", the bidirectional buffers are forced to a high impedance state). High order address bits $\overline{A9}$, A8 are fixed in the PSG design to recognize a 01 code; high order address bits DA7--DA4 may be mask-programmed to any 4-bit code by a special order factory mask modification. Unless otherwise specified, address bits DA7--DA4 are programmed to recognize only a 0000 code. A valid high order address latches the register address (the low order 4 bits) in the Register Address Latch/Decoder block. A latched address will remain valid until the receipt of a new address, enabling multiple reads and writes of the same register contents without the need for redundant re-addressing.

Conditioning of the Register Address Latch/Decoder and the Bidirectional Buffers to recognize the bus function required (inactive, latch address, write data, or read data) is accomplished by the Bus Control Decode block.

SOUND GENERATING BLOCKS

The basic blocks in the PSG which produce the programmed sounds include:

Tone Generators	produce the basic square wave tone frequencies for each channel (A,B,C)
Noise Generator	produces a frequency modulated pseudo random pulse width square wave output.
Mixers	combine the outputs of the Tone Generators and the Noise Generator. One for each channel (A,B,C).
Amplitude Control	provides the D/A Converters with either a fixed or variable amplitude pattern. The fixed amplitude is under direct CPU control; the variable amplitude is accomplished by using the output of the Envelope Generator.
Envelope Generator	produces an envelope pattern which can be used to amplitude modulate the output of each Mixer.
D/A Converters	the three D/A Converters each produce up to a 16 level output signal as determined by the Amplitude Control.

I/O PORTS

Two additional blocks are shown in the PSG Block Diagram which have nothing directly to do with the production of sound—these are the two I/O Ports (A and B). Since virtually all uses of microprocessor-based sound would require interfacing between the outside world and the processor, this facility has been included in the PSG. Data to/from the CPU bus may be read/written to either of two 8-bit I/O Ports without affecting any other function of the PSG. The I/O Ports are TTL-compatible and are provided with internal pull-ups on each pin. Both Ports are available on the AY-3-8910; only I/O Port A is available on the AY-3-8912; no ports are available on the AY-3-8913.

PSG BLOCK DIAGRAM

OPERATION

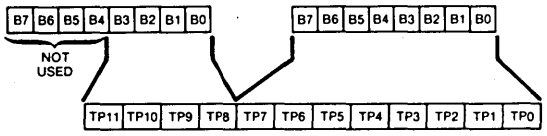
Since all functions of the PSG are controlled by the process, via a series of register loads, a detailed description of the PSG operation can best be accomplished by relating each PSG function to the control of its corresponding register. The function of creating or programming a specific sound or sound effect logically follows the control sequence listed:

Operation	Registers	Function
Tone Generator Control	R0--R5	Program tone periods.
Noise Generator Control	R6	Program noise period.
Mixer Control	R7	Enable tone and/or noise on selected channels.
Amplitude Control	R10--R12	Select "fixed" or "envelope-variable" amplitudes.
Envelope Generator Control	R13--R15	Program envelope period and select envelope pattern

Tone Generator Control
(Registers R0, R1, R2, R3, R4, R5)

The frequency of each square wave generated by the three Tone Generators (one each for Channels A, B, and C) is obtained in the PSG by first counting down the input clock by 16, then by further counting down the result by the programmed 12-bit Tone Period value. Each 12-bit value is obtained in the PSG by combining the contents of the relative Coarse and Fine Tune registers, as illustrated in the following:

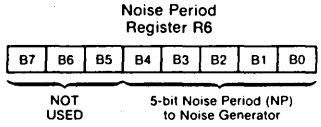
Coarse Tune Register	Channel	Fine Tune Register
R1	A	R0
R3	B	R2
R5	C	R4



12-bit Tone Period (TP) to Tone Generator

Noise Generator Control
(Register R6)

The frequency of the noise source is obtained in the PSG by first counting down the input clock by 16, then by further counting down the result by the programmed 5-bit Noise Period value. This 5-bit value consists of the lower 5 bits (B4--B0) of register R6, as illustrated in the following:



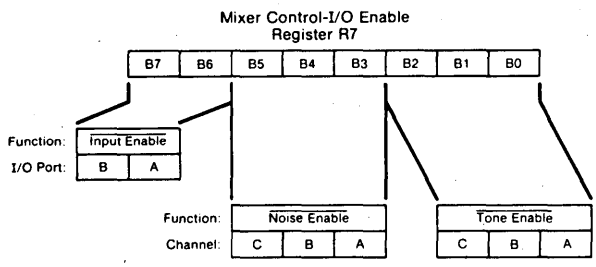
Mixer Control-I/O Enable
(Register R7)

Register R7 is a multi-function $\overline{\text{Enable}}$ register which controls the three Noise/Tone Mixers and the two general purpose I/O Ports.

The Mixers, as previously described, combine the noise and tone frequencies for each of the three channels. The determination of combining neither/either/both noise and tone frequencies on each channel is made by the state of bits B5--B0 of R7.

The direction (input or output) of the two general purpose I/O Ports (IOA and IOB) is determined by the state of bits B7 and B6 of R7.

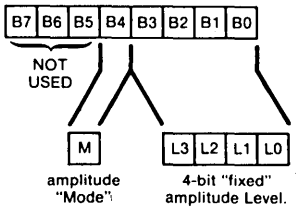
These functions are illustrated in the following:



Amplitude Control
(Registers R10, R11, R12)

The amplitudes of the signals generated by each of the three D/A Converters (one each for Channels A, B, and C) is determined by the contents of the lower 5 bits (B4--B0) of registers R10, R11, and R12 as illustrated in the following:

Amplitude Control Register	Channel
R10	A
R11	B
R12	C

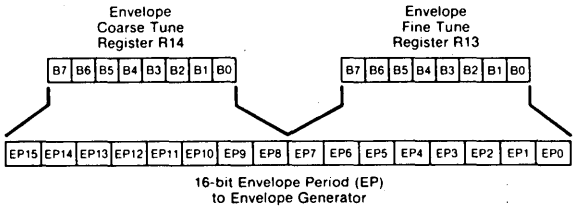


Envelope Generator Control
(Registers R13, R14, R15)

To accomplish the generation of fairly complex envelope patterns, two independent methods of control are provided in the PSG: first, it is possible to vary the frequency of the envelope using registers R13 and R14; and second, the relative shape and cycle pattern of the envelope can be varied using register R15. The following paragraphs explain the details of the envelope control functions, describing first the envelope period control and then the envelope shape/cycle control.

ENVELOPE PERIOD CONTROL (Registers R13, R14)

The frequency of the envelope is obtained in the PSG by first counting down the input clock by 256, then by further counting down the result by the programmed 16-bit Envelope Period value. This 16-bit value is obtained in the PSG by combining the contents of the Envelope Coarse and Fine Tune registers, as illustrated in the following:

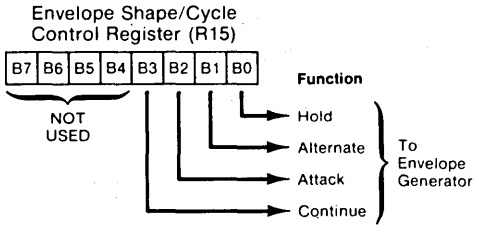


16-bit Envelope Period (EP) to Envelope Generator

ENVELOPE SHAPE/CYCLE CONTROL (Register R15)

The Envelope Generator further counts down the envelope frequency by 16, producing a 16-state per cycle envelope pattern as defined by its 4-bit counter output, E3 E2 E1 E0. The particular shape and cycle pattern of any desired envelope is accomplished by controlling the count pattern (count up/count down) of the 4-bit counter and by defining a single-cycle or repeat-cycle pattern.

This envelope shape/cycle control is contained in the lower 4 bits (B3--B0) of register R15. Each of these 4 bits controls a function in the envelope generator, as illustrated in the following:



© IC MASTER 1983

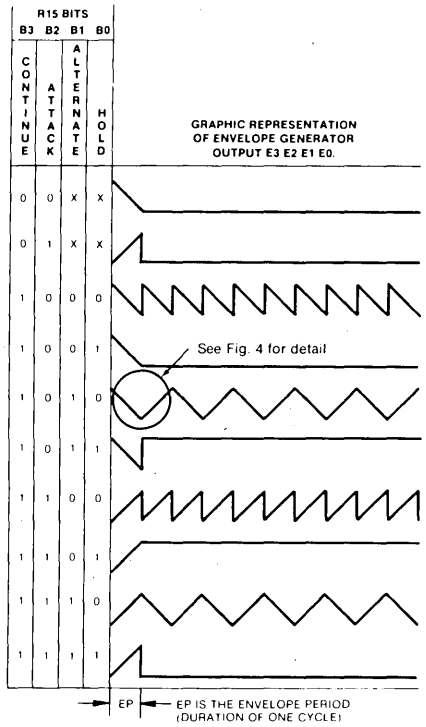


Fig. 1 ENVELOPE SHAPE/CYCLE OPERATION

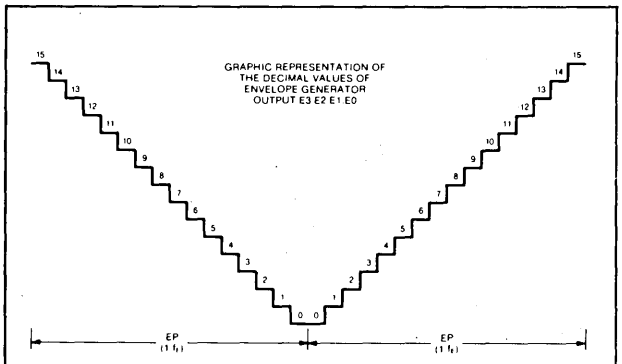

Fig. 2 DETAIL OF TWO CYCLES OF Fig. 1 (ref. waveform "1010" in Fig. 1)

I/O Port Data Store (Registers R16, R17)

Registers R16 and R17 function as intermediate data storage registers between the PSG/CPU data bus (DA0--DA7) and the two I/O ports (IOA7--IOA0 and IOB7--IOB0). Both ports are available in the AY-3-8910; only I/O Port A is available in the AY-3-8912; none are available on the AY-3-8913. Using registers R16 and R17 for the transfer of I/O data has no effect on sound generation.

D/A Converter Operation

Since the primary use of the PSG is to produce sound for the highly imperfect amplitude detection mechanism of the human ear, the D/A conversion is performed in logarithmic steps with a normalized voltage range of from 0 to 1 Volt. The specific amplitude control of each of the three D/A Converters is accomplished by the three sets of 4-bit outputs of the Amplitude Control block, while the Mixer outputs provide the base signal frequency (Noise and/or Tone).

80C86

PRODUCT BRIEF

CMOS 16 BIT MICROPROCESSOR

Features

- 1 MBYTE OF DIRECT MEMORY ADDRESSING CAPABILITY
- 24 OPERAND ADDRESSING MODES
- BIT, BYTE, WORD, AND BLOCK OPERATIONS
- 8 and 16 BIT SIGNED/UNSIGNED ARITHMETIC
  - BINARY or DECIMAL
  - MULTIPLY and DIVIDE
- BUS-HOLD CIRCUITRY ELIMINATES PULL-UP RESISTORS
- ARCHITECTURE DESIGNED FOR EFFICIENT HIGH LEVEL LANGUAGE OPERATION
- MULTIBUS® SYSTEM COMPATIBLE INTERFACE
- SCALED SAJI IV CMOS PROCESS – LOW POWER OPERATION
- SINGLE 5V POWER SUPPLY
- INDUSTRIAL and MILITARY TEMPERATURE RANGES

Description

The Harris 80C86 high performance 16 bit CMOS CPU is manufactured using a self-aligned silicon gate CMOS process (Scaled SAJI IV). Two modes of operation, MINimum for small systems and MAXimum for larger applications such as multi-processing, allow user configuration to achieve the highest performance level. The Harris 80C86 is available in a 40 pin industry standard ceramic DIP package and two operating frequencies: 5 MHz and 8 MHz.

*MULTIBUS IS A TRADEMARK OF INTEL CORPORATION

82C54

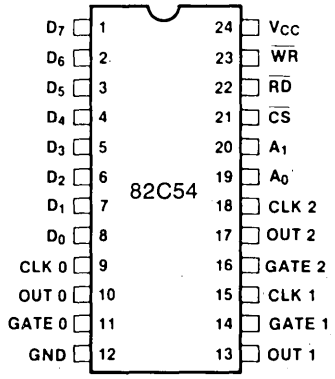
CMOS PROGRAMMABLE INTERVAL TIMER

PRODUCT BRIEF

Features

- THREE INDEPENDENT 16 BIT COUNTERS
- SIX PROGRAMMABLE COUNTER MODES
- STATUS READ-BACK COMMAND
- BINARY OR BCD COUNTING
- FULLY TTL COMPATIBLE
- HIGH SPEED, NO "WAIT STATE" OPERATION WITH 8 MHz 80C86
- PIN COMPATIBLE WITH NMOS 8254
- ENHANCED VERSION OF NMOS 8253
- SCALED SAJI IV CMOS PROCESS
- SINGLE 5V POWER SUPPLY
- LOW STANDBY POWER
- INDUSTRIAL and MILITARY TEMPERATURE RANGES

Pinout



Description

The Harris 82C54 is a high performance CMOS Programmable Interval Timer manufactured using a self-aligned silicon gate CMOS process (Scaled SAJI IV). The 82C54 has three independently programmable and functional 16 bit counters with each capable of handling clock input frequencies of up to 10 MHZ. The high speed and industry standard configuration of the 82C54 make it compatible with microprocessors such as the 80C86, 8048, 8051, and NSC800.

Six programmable timer modes allow the 82C54 to be used as an event counter, elapsed time indicator, programmable one-shot along with many other applications.

Static CMOS circuit design insures low operating power. Harris's advanced SAJI process results in performance equal to or greater than existing equivalent products with a significant reduction in power.

82C55A

CMOS PROGRAMMABLE PERIPHERAL INTERFACE

PRODUCT BRIEF

Features

- 24 PROGRAMMABLE I/O PINS
- FULLY TTL COMPATIBLE
- BUS-HOLD CIRCUITRY ON ALL I/O PORTS ELIMINATES PULL-UP RESISTORS
- HIGH SPEED, NO "WAIT STATE" OPERATION WITH 8MHz 80C86
- DIRECT BIT SET/RESET CAPABILITY
- PIN COMPATIBLE WITH NMOS 8255A
- ENHANCED CONTROL WORD READ CAPABILITY
- SCALED SAJI IV CMOS PROCESS
- SINGLE 5V POWER SUPPLY
- 2.5 mA DRIVE CAPABILITY ON ALL I/O PORT OUTPUTS
- LOW STANDBY POWER
- INDUSTRIAL AND MILITARY TEMPERATURE RANGES

Description

The Harris 82C55A is a high performance CMOS version of the industry standard 8255A and is manufactured using a self-aligned silicon gate CMOS process (Scaled SAJI IV). It is a general purpose programmable I/O device which may be used with many different microprocessors. There are 24 I/O pins which may be individually programmed in 2 groups of 12 and used in 3 major modes of operation. The high performance and industry standard configuration of the 82C55A make it compatible with microprocessors such as the 80C86, 8048, 8051, and NSC800.

Static CMOS circuit design insures low operating power. TTL compatibility of VIH = 2.0 volts over the industrial temperature range and bus hold circuitry eliminate the need for pull-up resistors. Harris's advanced SAJI process results in performance equal to or greater than existing equivalent products at a fraction of the power.

82C59A

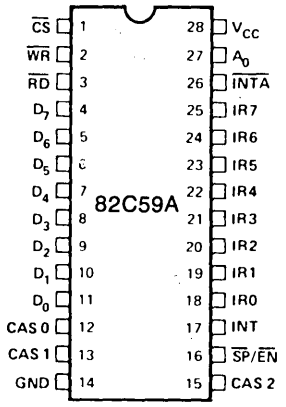
CMOS PROGRAMMABLE INTERRUPT CONTROLLER

PRODUCT BRIEF

Features

- EIGHT LEVEL PRIORITY CONTROLLER
- EXPANDABLE TO 64 LEVELS
- FULLY TTL COMPATIBLE
- HIGH SPEED, NO "WAIT STATE" OPERATION WITH 8 MHz 80C86
- PIN COMPATIBLE WITH NMOS 8259A
- PROGRAMMABLE INTERRUPT MODES
- INDIVIDUAL REQUEST MASK CAPABILITY
- FULLY STATIC DESIGN
- SCALED SAJI IV CMOS PROCESS
- SINGLE 5V POWER SUPPLY
- LOW STANDBY POWER
- INDUSTRIAL and MILITARY TEMPERATURE RANGES

Pinout



Description

The Harris 82C59A is a high performance CMOS Priority Interrupt Controller manufactured using a self-aligned silicon gate CMOS process (Scaled SAJI IV). The 82C59A is designed to relieve the system CPU from the task of polling in a multi-level priority interrupt system. The high speed and industry standard configuration of the 82C59A make it compatible with microprocessors such as the 80C86, 8048, 8051, and NSC800.

The 82C59A can handle up to eight vectored priority interrupting sources and is cascadable to 64 without additional circuitry. Individual interrupting sources can be masked or prioritized to allow custom system configuration.

Static CMOS circuit design insures low operating power. Harris's advanced SAJI process results in performance equal to or greater than existing equivalent products at a fraction of the power.

CMOS OCTAL LATCHING BUS DRIVER

JUNE 1982 **Advance Information**

Features

- FULL EIGHT BIT PARALLEL LATCHING BUFFER
- BIPOLAR 8282 COMPATIBLE
- THREE STATE NON-INVERTING OUTPUTS
- PROPAGATION DELAY – 35nsec MAX.
- A.C. CHARACTERISTICS GUARANTEED FOR:
  - ▶ FULL TEMPERATURE RANGE
  - ▶ 10% POWER SUPPLY TOLERANCE
  - ▶ C_L = 300pF
- SINGLE 5V POWER SUPPLY
- POWER SUPPLY CURRENT – 10μA MAX. STANDBY
- OUTPUTS GUARANTEED VALID AT V_{CC} = 2.0 VOLTS
- INDUSTRIAL AND MILITARY TEMPERATURE RANGES
- 20 PIN PACKAGE ON 0.3" CENTERS

Description

The Harris 82C82 is an octal latching buffer manufactured using a self-aligned silicon gate CMOS process. This circuit provides an eight bit parallel latch/buffer in a 20 pin package. The active high strobe (STB) input allows transparent transfer of data and latches data on the negative transition of this signal. The active low output enable ($\overline{OE}$) permits simple interface to state-of-the-art microprocessor systems.

82C84A

CMOS Clock Generator Driver

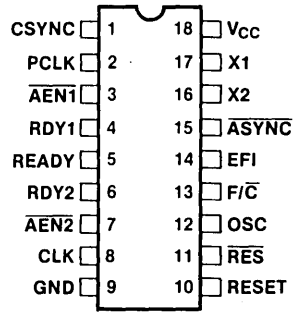
AUGUST 1982

Advance Information

Features

- GENERATES THE SYSTEM CLOCK FOR CMOS OR NMOS MICROPROCESSORS
- UP TO 25 MHZ OPERATION
- USES A PARALLEL MODE CRYSTAL CIRCUIT OR EXTERNAL FREQUENCY SOURCE
- PROVIDES READY SYNCHRONIZATION
- GENERATES SYSTEM RESET OUTPUT FROM SCHMITT TRIGGER INPUT
- CAPABLE OF CLOCK SYNCHRONIZATION WITH OTHER 82C84As
- TTL COMPATIBLE INPUTS/OUTPUTS
- VERY LOW POWER CONSUMPTION
- 18 PIN PACKAGE
- SINGLE +5V POWER SUPPLY
- INDUSTRIAL AND MILITARY TEMPERATURE RANGES AVAILABLE

Pinout



Description

The Harris 82C84A is a high performance CMOS clock generator-driver which is designed to service the requirements of both CMOS and NMOS microprocessors such as the 80C86, 80C88, 8086 and the 8088. The chip contains a crystal controlled oscillator, a divide-by-three counter and complete "Ready" synchronization and reset logic.

Static CMOS circuit design permits operation with an external frequency source from DC to 25MHz. Crystal controlled operation to 25MHz is guaranteed with the use of a parallel, fundamental mode crystal and two small load capacitors.

All inputs (except X1, X2 and $\overline{RES}$) are TTL compatible with a V_{IH} of 2.0 volts over the industrial temperature and voltage ranges.

Power consumption is a fraction of that of the equivalent bipolar circuits. This speed-power characteristic of CMOS permits the designer to custom tailor his system design with respect to power and/or speed requirements.

CONTROL PIN	LOGICAL 1	LOGICAL 0
F/$\overline{C}$	External Clock	Crystal Drive
$\overline{RES}$	Normal	Reset
RDY1 RDY2	Bus Ready	Bus not ready

HARRIS

82C88

PRODUCT BRIEF

CMOS BUS CONTROLLER

Features

- PROVIDES ADVANCED COMMANDS FOR MULTI-MASTER BUSSES
- 3-STATE COMMAND OUTPUTS
- BIPOLAR DRIVE CAPABILITY
- FULLY TTL COMPATIBLE
- PIN COMPATIBLE WITH BIPOLAR 8288
- SCALED SAJI IV CMOS PROCESS
- SINGLE 5V POWER SUPPLY
- LOW STANDBY POWER
- INDUSTRIAL and MILITARY TEMPERATURE RANGES

Description

The Harris 82C88 is a high performance CMOS Bus Controller manufactured using a self-aligned silicon gate CMOS process (Scaled SAJI IV). The 82C88 provides the control and command timing signals for 80C86 and 8086/88 systems. The high output drive capability of the 82C88 eliminates the need for additional bus drivers. High speed and industry standard configuration make the 82C88 compatible with microprocessors such as the 80C86, 8086, and 8088.

Static CMOS circuit design insures low operating power. Harris's advanced SAJI process results in performance equal to or greater than existing equivalent products at a significant power savings.

HD-6120

CMOS HIGH SPEED 12 BIT MICROPROCESSOR

Advance Information

Features

- Low power, 50 mw operating, 2 mw static
- Single Supply – 5v
- Operation from DC to 5.1 Mhz
- Industrial and Military temperature ranges
- On-chip crystal oscillator circuitry
- On-chip extended memory addressing – 32k main memory, 32k control panel
- Optimized micro-code minimizes the number of clock cycles required for all instructions
- Two on-chip stack pointers
- Simplified memory and I/O control signals for easy hardware interfacing
- Vectored interrupt capability
- Software is page relocatable

Description

The HD-6120 is a general purpose high speed, CMOS 12 bit microprocessor. It is designed to recognize the instruction set of Digital Equipment Corporations PDP-8/E* minicomputer.

Many architectural, functional and processing enhancements have been designed into the 6120 such that it can provide much higher system performance than its predecessor, the 6100.

The 6120 is targeted toward the experienced PDP-8* or 6100 user. Twelve bit accuracy, rapid interrupt response, battery backup and low power (sealed enclosure) capability all equate to a processor ideally suited to real time control applications such as data acquisition, industrial control and harsh environment military systems.

HARRIS

HD-6121

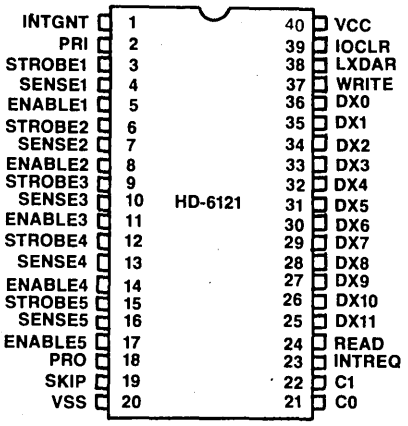
Advance Information

CMOS I/O CONTROLLER

Features

- Low power, Typ. < 2 mw
- Single Supply – 5v
- Industrial and Military temperature ranges
- 6120 compatible interface
- Controls any combination of five input or output ports with handshaking
- Eliminates gated Read and Write signals through the controller
- Conforms to DEC* conventions regarding device addressing and commands
- Independent programming of each device's address and data direction
- Complete interrupt and skip logic for each device including priority interrupt vectoring
- STROBE outputs are programmable high or low true
- SENSE inputs are programmable for level or edge sensitivity
- ENABLE outputs function as user programmable chip selects

Pinout



Description

The HD-6121 Input/Output Controller (IOC) is a high performance, CMOS support circuit for the 6120 microprocessor. Fully programmable, this device offers independent control of any combination of five, 12 bit input or output ports.

Used in conjunction with the 6120 microprocessor, the 6121 provides user programmable chip select decoding, priority vectored interrupt control, software readable status and I/O port handshaking signals.

The Priority In (PRI) and Priority Out (PRO) control signals permit up to eleven 6121s to be used without any additional hardware. Industrial control and other I/O intensive systems can profit greatly from the highly hardware/software efficient capability provided by the 6120/6121 chip set.

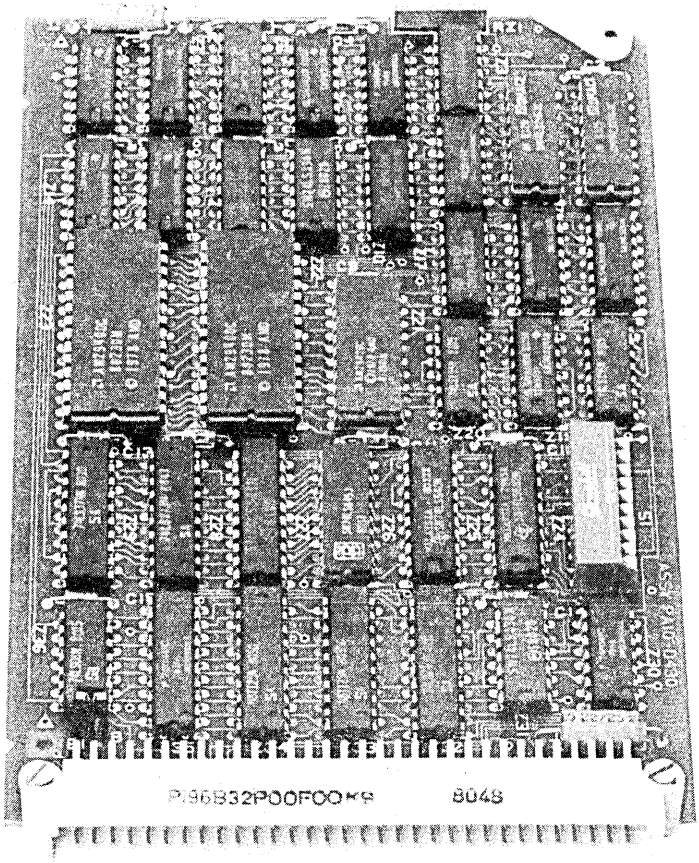
For Key Data On Every IC On This Board, The Place To Look Is...



This Rockwell RM65-5104(E) card is used to transfer data between memory and peripheral circuits.

Device No.	Description
74LS08	Quad 2-Input AND Gate
74F244	Octal Buffer/Line Driver
74LS240	Octal Bus Driver (Schmitt Trigger)
74LS136	Quad 2-Input Exclusive-OR Gate
74F04	Hex Inverter
74LS374	Octal D-Type Edge-Triggered Flip-Flop, 3-State
74LS273	Octal Edge-Triggered Flip-Flop with Clear
74LS541	Octal Bus Driver, Noninverting
74LS645	Octal Bus Transceiver
74LS540	Octal Bus Driver, Inverting

Device No.	Description
74LS682	8-Bit Magnitude Comparitor
AM2940	DMA Address Generator
AM2942	Programmable Timer
74LS155	Decoder/Demultiplexer
74LS148	Priority Encoder
74LS74	Dual D-Type Edge-Triggered Flip-Flop
74LS32	Quadruple 2-Input OR Gate
74LS112	Dual J-K Flip-Flop
74LS126	Quadruple Bus Buffer Gate
74LS00	Quadruple 2-Input NAND Gate
PAL12H6	Field Programmable Array

Representative list of ICs on Rockwell Direct Memory Access Card.

iAPX 86/10
16-BIT HMOS MICROPROCESSOR

8086/8086-2/8086-1

- Direct Addressing Capability to 1 MByte of Memory
- Architecture Designed for Powerful Assembly Language and Efficient High Level Languages.
- 14 Word, by 16-Bit Register Set with Symmetrical Operations
- 24 Operand Addressing Modes
- Bit, Byte, Word, and Block Operations
- 8 and 16-Bit Signed and Unsigned Arithmetic in Binary or Decimal Including Multiply and Divide
- Range of Clock Rates:
  5 MHz for 8086,
  8 MHz for 8086-2,
  10 MHz for 8086-1
- MULTIBUS® System Compatible Interface

ORDER NUMBER: 205025-001

iAPX 88/10
8-BIT HMOS MICROPROCESSOR
8088/8088-2

- 8-Bit Data Bus Interface
- 16-Bit Internal Architecture
- Direct Addressing Capability to 1 Mbyte of Memory
- Direct Software Compatibility with iAPX 86/10 (8086 CPU)
- 14-Word by 16-Bit Register Set with Symmetrical Operations
- 24 Operand Addressing Modes
- Byte, Word, and Block Operations
- 8-Bit and 16-Bit Signed and Unsigned Arithmetic in Binary or Decimal, Including Multiply and Divide
- Compatible with 8155-2, 8755A-2 and 8185-2 Multiplexed Peripherals
- Two Clock Rates:
  5 MHz for 8088
  8 MHz for 8088-2

ORDER NUMBER: 205880-001

iAPX 186
HIGH-INTEGRATION 16-BIT MICROPROCESSOR

- Integrated Feature Set
  - —Enhanced 8086-2 CPU
  - —Clock Generator
  - —2 Independent, High-Speed DMA Channels
  - —Programmable Interrupt Controller
  - —3 Programmable 16-bit Timers
  - —Programmable Memory and Peripheral Chip-Select Logic
  - —Programmable Wait State Generator
  - —Local Bus Controller
- High-Performance 8 MHz Processor
  - —2 Times the Performance of the Standard iAPX 86
  - —4 MByte/Sec Bus Bandwidth Interface
- Direct Addressing Capability to 1 MByte of Memory
- Completely Object Code Compatible with All Existing iAPX 86, 88 Software
  - —10 New Instruction Types
- Compatible with 8282/83/86/87, 8288, 8289 Bus Support Components
- Complete System Development Support
  - —Development Software: Assembler, PL/M, Pascal, Fortran, and System Utilities
  - —In-Circuit-Emulator (ICE™-186)
  - —iRMX™ 86, 88 Compatible (80130 OSF)
- Optional Numeric Processor Extension
  - —iAPX 186/20 High-Performance 80-bit Numeric Data Processor

ORDER NUMBER: 210451-001

iAPX 286/10
HIGH PERFORMANCE MICROPROCESSOR WITH MEMORY MANAGEMENT AND PROTECTION

- High Performance 8 and 10 MHz Processor (Up to six times iAPX 86)
- Large Address Space:
  —16 Megabytes Physical
  —1 Gigabyte Virtual per Task
- Integrated Memory Management, Four-Level Memory Protection and Support for Virtual Memory and Operating Systems
- Two iAPX 86 Upward Compatible Operating Modes:
  —iAPX 86 Real Address Mode
  —Protected Virtual Address Mode
- Optional Processor Extension:
  —iAPX 286/20 High Performance 80-bit Numeric Data Processor
- Complete System Development Support:
  —Development Software: Assembler, PL/M, Pascal, FORTRAN, and System Utilities
  —In-Circuit-Emulator (ICE™-286)
- High Bandwidth Bus Interface (8 or 10 Megabyte/Sec)
- Available in EXPRESS:
  —Standard Temperature Range

ORDER NUMBER: 210253-001

iAPX 188
HIGH INTEGRATION 8-BIT MICROPROCESSOR

- Integrated Feature Set
  —Enhanced 8 MHz 8088-2 CPU
  —Clock Generator
  —2 Independent, High-Speed DMA Channels
  —Programmable Interrupt Controller
  —3 Programmable 16-bit Timers
  —Programmable Memory and Peripheral Chip-Select Logic
  —Programmable Wait State Generator
  —Local Bus Controller
- 8-Bit Data Bus Interface; 16-Bit Internal Architecture
- Completely Object Code Compatible with All Existing iAPX 86, 88 Software
  —10 New Instruction Types
- Direct Addressing Capability to 1 MByte of Memory
- Compatible with 8282/83/86/87, 8288, 8289 Bus Support Components
- Complete System Development Support
- Optional Numeric Processor Extension
  —iAPX 188/20 High-Performance 80-Bit Numeric Data Processor

ORDER NUMBER:210451-001

8 AND 16 BIT
COPROCESSORS

iAPX 86/20, iAPX 88/20
NUMERIC DATA PROCESSOR

- High Performance 2-Chip Numeric Data Processor
- Standard iAPX 86/10, 88/10 Instruction Set Plus Arithmetic, Trigonometric, Exponential, and Logarithmic Instructions For All Data Types
- All 24 iAPX 86/10, 88/10 Addressing Modes Available
- Conforms To Proposed IEEE Floating Point Standard
- Support 8 Data Types: 8-, 16-, 32-, 64-Bit Integers, 32-, 64-, 80-Bit Floating Point, and 18-Digit BCD Operands
- 8x80-Bit Individually Addressable Register Stack plus 14 General Purpose Registers
- 7 Built-in Exception Handling Functions
- MULTIBUS® System Compatible Interface

ORDER NUMBER: 205835-001

iAPX 86/30
iAPX 88/30
OPERATING SYSTEM PROCESSORS

80130-3

- High-Performance 2-Chip Data Processors Containing Operating System Primitives
- Standard iAPX 86/10, 88/10 Instruction Set Plus Task Management, Interrupt Management, Message Passing, Synchronization and Memory Allocation Primitives
- Fully Extendable To and Compatible With iRMX™ 86
- Supports Five Operating System Data Types: Jobs, Tasks, Segments, Mailboxes, Regions
- 35 Operating System Primitives
- Built-In Operating System Timers and Interrupt Control Logic Expandable From 8 to 57 Interrupts
- 8086/8087/8088 Compatible At Up To 8 MHz Without Wait States
- MULTIBUS® System Compatible Interface

ORDER NUMBER: 210216-001

iAPX 86/50, 88/50, 186/50
CP/M-86* OPERATING SYSTEM PROCESSORS

(80150-2)

- High-Performance Two-Chip Data Processors Containing the Complete CP/M-86 Operating System
- Standard On-Chip BIOS (Basic Input/Output System) Contains Drivers for 8272A, 8275, 8274, 8255A, 8251A, 8237A
- BIOS Extensible with User-Supplied Peripheral Drivers
- User Intervention Points Allow Addition of New System Commands
- Memory Disk Makes Possible Diskless CP/M-86 Systems
- No License or Serialization Required
- Built-in Operating System Timers and Interrupt Controller
- 8086/8087/8088/80186 Compatible at Up to 8 MHz Without Wait States

*CP/M is a registered trademark of Digital Research

ORDER NUMBER: 210705-001

8089
8 & 16-BIT HMOS I/O PROCESSOR

- High Speed DMA Capabilities Including I/O to Memory, Memory to I/O, Memory to Memory, and I/O to I/O
- iAPX 86, 88 Compatible: Removes I/O Overhead from CPU in iAPX 86/11 or 88/11 Configuration
- Allows Mixed Interface of 8- & 16-Bit Peripherals, to 8- & 16-Bit Processor Busses
- 1 Mbyte Addressability
- Memory Based Communication with CPU
- Supports LOCAL or REMOTE I/O Processing
- Flexible, Intelligent DMA Functions Including Translation, Search, Word Assembly/Disassembly
- MULTIBUS® Compatible System Interface

ORDER NUMBER: 205965-001

© IC MASTER 1983

80287 80-Bit HMOS NUMERIC PROCESSOR EXTENSION

- Full Internal 80-Bit Architecture for High Performance
- Implements Proposed IEEE Floating Point Standard
- Total Numeric Support for iAPX 286/20 Systems
- Expands iAPX 286/10 Datatypes to Include 32-, 64-, 80-Bit Floating Point, and 18-Digit BCD Operands
- All iAPX 286/10 Addressing Modes and Protection Available
- Directly Extends iAPX 286/10 Instruction Set to Trigonometric, Logarithmic, Exponential and Arithmetic Instructions for All Datatypes
- 8x80-Bit, Individually Addressable, Numeric Register Stack
- Built-in Exception Handling Functions

ORDER NUMBER: 210704-001

ADVANCED PERIPHERAL CONTROLLERS

82586 LOCAL AREA NETWORK COMMUNICATIONS CONTROLLER

- Fully Implements the Ethernet* Specification
- Serial Transmission up to 10M Bits/Sec
- User Configurable
  - —From 1 to 6 Bytes of Address Generation/Checking
  - —16- or 32-Bit CRC Generation/Checking
  - —Prioritization of Frames
  - —Variable Preamble Length
  - —Serial Transmission from 500 KHz up to 10M Bits/Sec
  - —8- or 16-Bit Data Bus
- On-Chip Processor Executes Command Lists and Controls All Transmission and Reception
- On-Chip DMA for Efficient, High-Speed Transfer of Data, Status and Commands
- Complete Set of Diagnostics for Reliable Network Operation
- Fully Implements the CSMA/CD Access Method Including Retries and Random Backoff (Wait) Time

*Ethernet is a registered trademark of Xerox Corp.

ORDER NUMBER: 210783-001

82720 GRAPHICS DISPLAY CONTROLLER

- High-Performance Graphics for Siggraph Core-, N.A.P.L.P.S.- and ANSI VDI-Compatible or Custom Systems
- Displays Low-to-High Resolution Images
- Draws Characters, Points, Lines, Arcs and Rectangles
- Supports Monochrome, Greyscale or Color Displays
- Zooms, Pans and Windows Through a 1/2-Mbyte Display Memory
- Extremely Flexible Programmable Screen Display, Blanking and Sync Formats
- Compatible with Intel's MCS®-51 and iAPX 88/86/186 Microprocessor Families
- High-Level Commands Off Load the Master Processor from Bit Map Loading and Screen Refresh Tasks
- Supports Graphics, Character, and Mixed Display Modes

ORDER NUMBER: 210655-001

THE M6800 FAMILY

The MC6800 microprocessor was the first MPU of the M6800 Family and still remains a highly cost-effective processor for a great many process-control and data-communications applications. Seventy-two powerful instructions and six different addressing modes give it unexcelled capability, and a full range of compatible peripheral chips offer the widest possible lattitude in system implementation. After years of field experience, the MC6800 has earned an enviable reputation as one of the easiest-to-use processors available.

Moreover, to tailor the system to your specific needs at the lowest cost, the MC6800 (and its peripherals) is available in three different packages, two different temperature ranges and three speed ranges.

The table to the right lists devices in the M6800 Family. The following microprocessor and microcomputer families are derivations and enhancements of the MC6800 architecture to provide easy migration within the M6800 Family as processing-power requirements change.

Device	Function
MC6800	MPU
MC6802	MPU (with Clock, RAM)
MC6808	MPU (with Clock)
MCM6810	128 x 8 Static RAM
MC6821	Peripheral Interface Adapter
MC6822	Industrial Interface Adapter
MC6828*	Priority Interrupt Controller
MC6829	Memory Management Unit
MC6835	CRT Controller with ROM
MC6839	Floating Point ROM (IEEE Standard Draft 6.0)
MC6840	Programmable Timer
MC6843	Floppy-Disk Controller
MC6844	Direct Memory Access Controller
MC6845	CRT Controller
MC6846	ROM-I/O-Timer
MC6847, Y	Video Display Generator
MC6850	Asynchronous Interface Adapter
MC6852	Synchronous Serial Data Adapter
MC6854	Advanced Data Link Controller
MC6859	Data Security Device
MC6860**	Digital Modem
MC6862**	Digital Modulation
MC68488	General-Purpose Interface Adapter

* Motorola Digital Bipolar
** Motorola Logic and Special Functions

THE M6801 FAMILY PROCESSORS: HIGH-PERFORMANCE MCUs

Frequency				Memory
1 MHz	1.25 MHz	1.5 MHz	2 MHz	
MC6801	MC6801-1	MC68A01	MC68B01	2048 ROM, 128 Bytes RAM, Expansion Bus
MC68701	MC68701-1	–	–	2048 EPROM, 128 Bytes RAM, Expansion Bus
MC6803	MC6803-1	MC68A03	MC68B03	No ROM, 128 Bytes RAM, Expansion Bus
MC6803E	MC6803E-1	–	–	No ROM, 128 Bytes RAM, External Clock, Expansion Bus

PART MARKING

SPEED DESIGNATION – The following letters identify the speed of the corresponding device.

MC68XX	1.0 MHz
MC68AXX	1.5 MHz
MC68BXX	2.0 MHz

In cases where a –1 follows the package designator, the device operates at 1.25 MHz (example: MC68XXL-1).

PACKAGE DESIGNATION – The part is marked with the following descriptors to identify the package type.

MC68XXP	Plastic
G	Plastic
L	Ceramic
S	Cerdip
Z	Leadless Chip Carrier

For further information on higher-speed extended-temperature devices, please contact your local Motorola Sales Office.

BETTER LEVEL – The part is marked with a suffix letter(s) as shown to indicate the level of testing that the part received.

MC68XX	CP	S
Part Identification	Standard Package Suffix C = Ext. Temp. (–40°C to +85°C)	"BETTER" Processing Level I = Suffix S Level II = Suffix D Level III = Suffix DS

© IC MASTER 1983

THE "BETTER" PROGRAM

Motorola standard commercial integrated circuits are manufactured under stringent in-process controls and quality inspections combined with the industry's finest outgoing quality inspections. The "BETTER" program offers three levels of extra processing, each tailored to meet different user needs at nominal costs.

The program is designed to:

- Eliminate Incoming Electrical Inspection
- Eliminate Need for Independent Test Labs and Associated Extra Time and Costs
- Reduce Field Failures
- Reduce Service Calls
- Reduce Equipment Downtime
- Reduce Board and System Rework
- Reduce Infant Mortality
- Save Time and Money
- Increase End-Customer Satisfaction

BETTER PROCESSING — STANDARD PRODUCT PLUS:

Level I (Suffix S)

- 100% temperature cycling per MIL-STD-883B, Method 1010, ten cycles from −25°C to +150°C.
- 100% high temperature functional test at t_{max}.

Level II (Suffix D)

- 100% burn-in to MIL-STD-883B test conditions equivalent to 160 hours at +125°C.
- 100% post burn-in DC parametric test at 25°C.

Level III (Suffix DS)

- Combination of Levels I and II above.

Test	Condition	AQL Level I	AQL Level II	AQL Level III
High Temperature Functional	$T_A = t_{max}$	0.15	0.15*	0.10
DC Parametric	$T_A = 25°C$	0.28	0.28	0.28
AC Parametric	$T_A = 25°C$	0.65	0.65	0.65
External Visual and Mechanical	Major Minor	0.11 2.50	0.11 2.50	0.11 2.50
Hermeticity (Not applicable to plastic package)	Gross	0.46	0.46	0.46

t_{max} = Maximum Operating Temperature of Device Under Test
*25°C

NOTES: 1. Major Defects — Affects Form, Fit, or Function
Minor Defects — Cosmetic
2. General Inspection Level II

MIL-STD-883B SCREENED MICROPROCESSORS AND PERIPHERALS

Basic Numbering Parameters — Example: MC68XX YYYY

MC68XX Y Y Y Y

- Motorola Device Type
- MIL-STD-883B Class
  B = Processed per 883B method 5004, QCI per 5005
- Case Outline
  J = 24 pin
  Q = 40 pin
  T = 28 pin
- Operating Temperature Range
  A = −55°C to +125°C
  E = −40°C to +85°C
  S = 0°C to +70°C

16-Bit Microprocessor Family

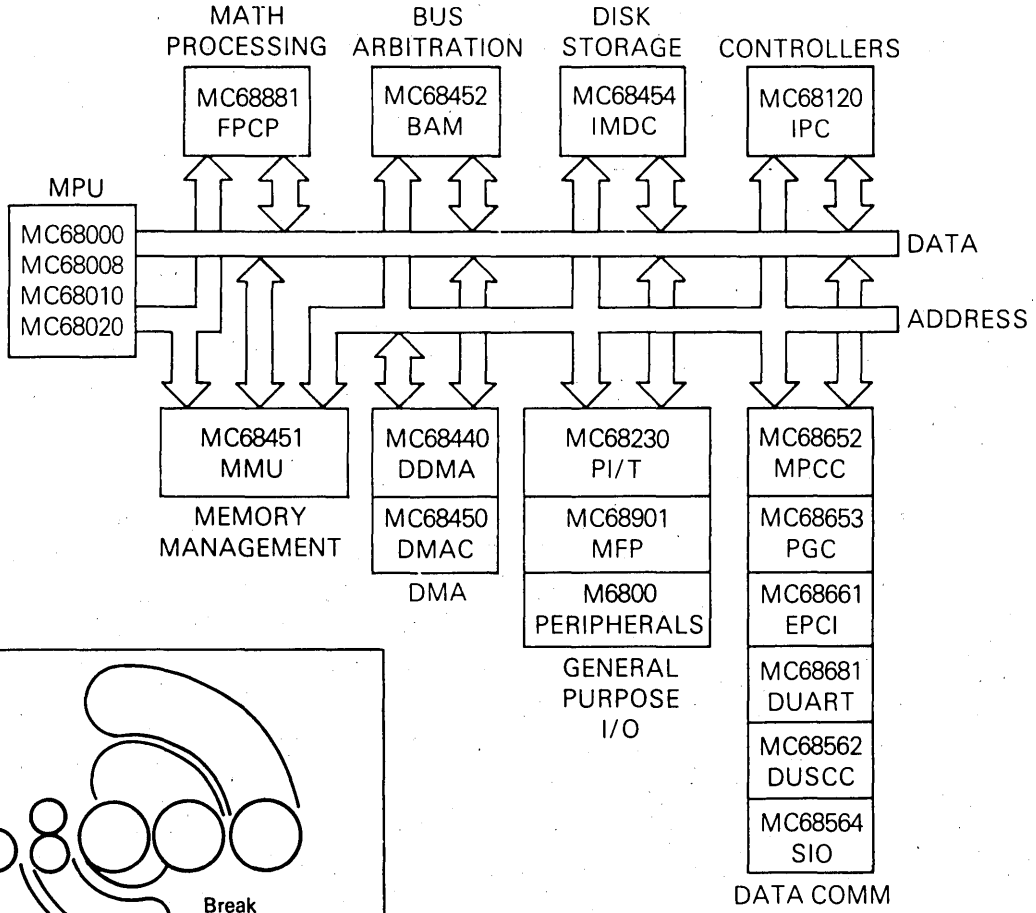
THE M68000 FAMILY — AN INVESTMENT IN THE FUTURE

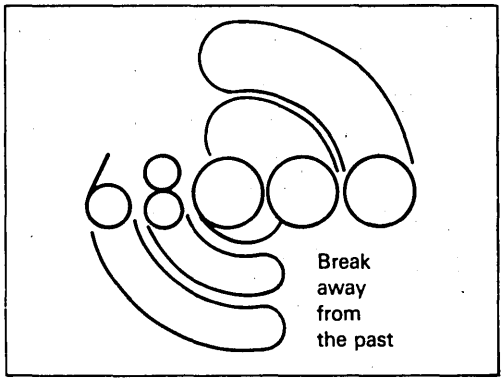
The family concept has been extremely popular in the Microprocessor industry. Motorola pioneered this family concept with the introduction of the M6800 Family in 1974. Led by the MC68000 Microprocessing Unit (MPU) in 1979 and followed by a host of peripherals, the M68000 Family offers the engineer a set of building blocks to construct cost-effective solutions to an ever-widening range of complex 16/32 bit applications. The tremendous popularity of the M68000 Family is not without warrant. HMOS technology, performance, and support are but a few of the many reasons why the M68000 Family continues to be the 16 bit industry leader.

It should be noted that the M68000 Family is a not-so-distant relative of the MC6800. All M6800 Family peripherals interface directly with the MC68000, so upward compatibility is built-in. Where low cost and medium performance are required, they present a very attractive alternative. The plan for the M68000 Family is a simple one. Provide the marketplace with the best 16-bit family and back it up with support that is second to none. And it's happening now.

What about expandability? The M68000 Family is designed with this in mind. All the way from an internally microcoded 32-bit architecture to the third-generation EXORmacs development system. Efficient high level language support provided by Pascal allows upward compatibility of software from 8-bit to 16-bit to 32-bit machines.

The majority of today's 16-bit microprocessor applications are quite complex, with long design times. Clearly, the required investment in design resources requires finished products to have increased longevity. Motorola understands this, and is committed to offering a family which will allow these products to remain state-of-the-art for years to come. Thus, the M68000 Family is an investment in the future.





EXORmacs is a trademark of Motorola Inc.

16-BIT MICROPROCESSING UNIT

MC68000L4 (4 MHz) **MC68000L6** (6 MHz) **MC68000L8** (8 MHz) **MC68000L10** (10 MHz)

MC68000L12 (12.5 MHz)

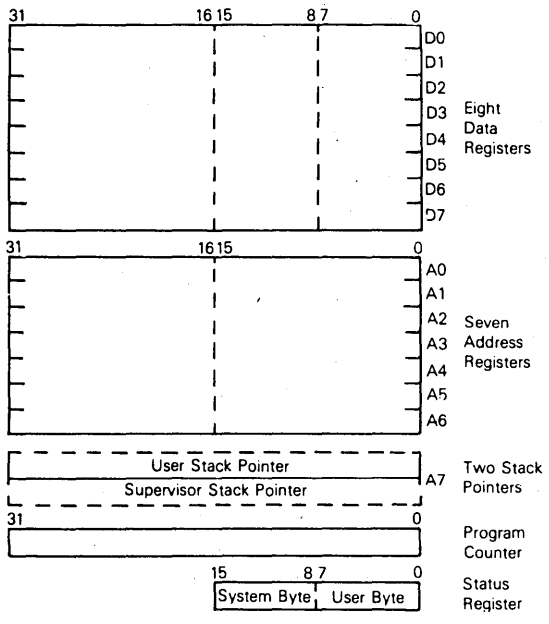
Advances in semiconductor technology have provided the capability to place on a single silicon chip a microprocessor at least an order of magnitude higher in performance and circuit complexity than has been previously available. The MC68000 is the first of a family of such VLSI microprocessors from Motorola. It combines state-of-the-art technology and advanced circuit design techniques with computer sciences to achieve an architecturally advanced 16-bit microprocessor.

The resources available to the MC68000 user consist of the following:

- 32-Bit Data and Address Registers
- 16 Megabyte Direct Addressing Range
- 56 Powerful Instruction Types
- Operations on Five Main Data Types
- Memory Mapped I/O
- 14 Addressing Modes

As shown in the programming model, the MC68000 offers seventeen 32-bit registers in addition to the 32-bit program counter and a 16-bit status register. The first eight registers (D0-D7) are used as data registers for byte (8-bit), word (16-bit), and long word (32-bit) data operations. The second set of seven registers (A0-A6) and the system stack pointer may be used as software stack pointers and base address registers. In addition, these registers may be used for word and long word address operations. All seventeen registers may be used as index registers.

PROGRAMMING MODEL



PIN ASSIGNMENT

REDUCED DATA BUS MC68000

MC68008

Mainframe architecture is now available for 8-bit systems. The new MC68008 member of the M68000 Family allows the design of cost effective systems using 8-bit data buses while providing the benefits of a 32-bit microprocessor architecture. The performance of the MC68008 is greater than any 8-bit microprocessor and superior to several 16-bit microprocessors.

The MC68008 is completely code compatible with the MC68000. This means that programs developed for the MC68000 will run on the MC68008 and vice versa. This applies equally to either source code or object code.

A system implementation based on an 8-bit data bus reduces system cost in comparison to 16-bit systems due to a more effective use of components. Byte-wide memories and peripherals can be used much more effectively. In addition, the non-multiplexed address and data buses eliminate the need for external demultiplexers, thus further simplifying the system.

The general purpose architecture of the MC68008 can easily satisfy market requirements for many diverse applications. The MC68008 provides the user with seventeen 32-bit registers, 56 basic instruction types, allows an efficient hardware system implementation, extensive exception processing capabilities and a 1 megabyte linear address space.

VIRTUAL MEMORY PROCESSOR

MC68010

The MC68010 is an MC68000 with enhancements that make it an ideal processor for virtual memory and virtual machine systems. Many of these changes concern the operation of the processor when a faulty bus cycle takes place.

The most significant MC68010 enhancement is the facility for complete, controlled storing of the internal processor state upon receipt of a bus error signal. This state can later be recovered by the processor for continuation after the faulty condition has been corrected. Additionally, the MC68010 may be used as a virtual processor with one governing operating system handling the supervisory chores of any number of subordinate operating systems. This also allows virtual input/output to be supported. A third major change is the allowance for a delayed bus error signal to abort a bus cycle. This bus relaxation allows error detection and correction (EDAC) to be performed with the MC68010 without impacting the execution time of instructions when no error occurs.

ENHANCED M68000 MICROPROCESSOR

MC68020

The MC68020 is another in a series of M68000 high performance 16/32-bit microprocessors from Motorola. Motorola's original MC68000 is the basis for this processor. This processor retains software compatibility with the MC68008, MC68000, and the MC68010.

The MC68020 is the first true 32-bit microprocessor. The power of the MC68020 allows its use in any application; even those previously limited to mainframes. Just as the MC68000 set the industry standard for 16-bit microprocessor performance, the MC68020 will be the standard for all 32-bit systems.

Motorola did not stop at merely rounding out the 32-bit architecture, but added instruction set enhancements, coprocessor operations, improved operating system support, cache for performance advantages, and innovative techniques to improve bus efficiency.

The MC68020 is designed to accommodate M68000 coprocessors through a special co-processor interface and using new co-processor commands. Use of co-processors extends the capability of an M68000 system beyond the limits of a single processing element to numerous tightly-coupled processing units, each of which may be tailored to a particular data type, task, instruction set, etc. To further enhance special operations in an M68000 system, an instruction cache is included in the MC68020. This cache will allow repeated instruction streams to execute significantly faster while freeing the external bus for other processors.

© IC MASTER 1983

FLOATING-POINT CO-PROCESSOR
MC68881

The MC68881 is a high-performance HMOS floating-point processor designed to interface with the advanced MC68020 microprocessor. It can also be used as a peripheral in systems with other processors. The MC68881 is a comprehensive floating-point co-processor that provides a wide range of floating point capabilities seldom found even in a large main-frame computer. System performance with the MC68020 is the overriding design goal of the MC68881.

INTELLIGENT PERIPHERAL CONTROLLER
MC68120, MC68121

The MC68120/MC68121 Intelligent Peripheral Controller (IPC) is a general purpose, mask programmable peripheral controller. The IPC provides the interface between an M68000 or M6800 Family microprocessor and the final peripheral devices through a system bus and control lines. System bus data is transferred to and from the IPC via dual-port RAM while the software utilizes the semaphore registers to control RAM tasking or any other shared resource. Multiple operating modes range from a single chip mode with 21 I/O lines and 2 control lines to an expanded mode supporting an address space of 64K bytes. The MC68120 has 2K bytes of on-chip ROM to make full use of all operating modes. The MC68121 utilizes only the expanded address modes, due to the absence of on-chip ROM.

A serial communications interface, 16-bit timer, dual-ported RAM and semaphore registers are available for use by the IPC in all operating modes.

- Upward Compatible with MC6800 Source and Object Code
- 2048 Bytes of ROM (MC68120 Only)
- 128 Bytes of Dual-Ported RAM
- Multiple Operation Modes Ranging from Single Chip to Expanded, with 64K Byte Address Space
- Six Shared Semaphore Registers
- 21 Parallel I/O Lines and 2 Handshake Lines (5 I/O Lines on MC68121)
- Serial Communications Interface (SCI)
- 16-Bit Three-Function Timer
- 8-Bit CPU and Internal Bus
- Halt/Bus Available Capability Control
- 8 × 8 Multiply Instruction
- TTL Compatible Inputs and Outputs
- External and Internal Interrupts

PARALLEL INTERFACE/TIMER
MC68230

The MC68230 Parallel Interface/Timer provides versatile double buffered parallel interfaces and an operating system oriented timer to MC68000 systems. The parallel interfaces operate in unidirectional or bidirectional modes, either 8 or 16 bits wide. In the unidirectional modes, an associated data direction register determines whether the port pins are inputs or outputs. In the bidirectional modes the data direction regsiters are ignored and the direction is determined dynamically by the state of four handshake pins. These programmable handshake pins provide an interface flexible enough for connection to a wide variety of low, medium, or high speed peripherals or other computer systems. The PI/T ports allow use of vectored or autovectored interrupts, and also provide a DMA Request pin for connection to the MC68450 Direct Memory Access Controller or a similar circuit. The PIT timer contains a 24-bit wide counter and a 5-bit prescaler. The timer may be clocked by the system clock (PI/T CLK pin) or by an external clock (TIN pin), and a 5-bit prescaler can be used. It can generate periodic interrupts, a square wave, or a single interrupt after a programmed time period. Also it can be used for elapsed time measurement or as a device watchdog.

- 8 MHz Version: MC68230L8
- 10 MHz Version: MC68230L10
- Unidirectional 8-Bit and 16-Bit Mode
- Bidirectional 8-Bit and 16-Bit Mode
- Selectable Handshaking Options
- 24-Bit Programmable Timer
- Software Programmable Timer Modes
- Contains Interrupt Vector Generation Logic
- Separate Port and Timer Interrupt Service Requests
- Registers are Read/Write and Directly Addressable
- Registers are Addressed for MOVEP (Move Peripheral) and DMAC Compatibility

© IC MASTER 1983

DUAL DIRECT MEMORY ACCESS CONTROLLER

MC68440

DIRECT MEMORY ACCESS CONTROLLER

MC68450

The MC68440 and MC68450 are designed to complement the performance and architectural capabilities of M68000 Family microprocessors by moving blocks of data in quick, efficient manner with minimum intervention by the host processor. The DMA/DDMA performs memory-to-memory and peripheral-to-memory data transfers by utilizing the following features:

- Bus Compatible with the MC68000, MC68008, and MC68010
- Compatible with M68000 Peripherals
- On-Chip Registers allow Complete Software Control by the System MPU
- Auto Request or External Request
- Memory-to-Memory, Memory-to-Device, and Device-to-Memory Transfers
- Programmable Channel Prioritization
- Vectored Interrupt Capabilities with Two Vectors per Channel
- Two Independent Channels — MC68440
- Four Independent Channels — MC68450
- MC68440 a Subset of MC68450 — Pin for Pin Compatible with the MC68450

MEMORY MANAGEMENT UNIT

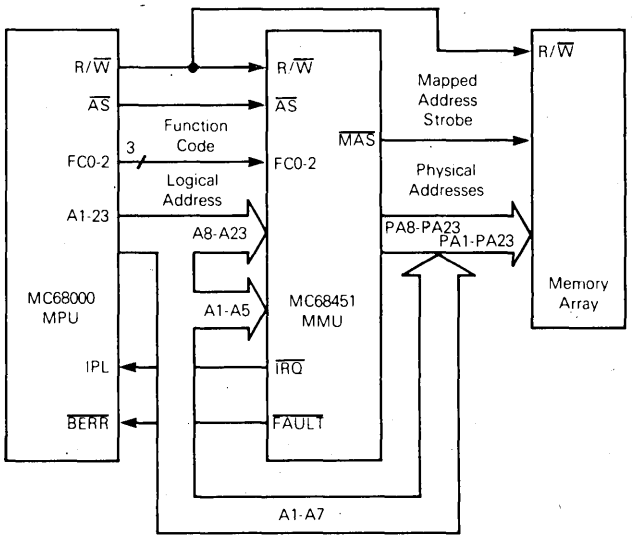
MC68451

The MC68451 Memory Management Unit (MMU) provides address translation and protection for the 16 megabyte addressing range of the MC68000 MPU. Each bus master (or processor) in the M68000 Family provides a function code and an address during each bus cycle. The function code specifies an address space and the address specifies a location within that address space. The function codes distinguish between User and Supervisor spaces and, within these, between Data and Program spaces. This separation of address spaces is the basis for memory management and protection by the operating system. Provision is also made for other bus masters, such as the MC68450 DMAC, to have separate address spaces for efficient DMA. A multitasking operating system is simplified and reliability is enhanced through the use of the MMU.

NEW TRANSLATION TIMES 125 ns at 8 MHz

- MC68000 Bus Compatible
- Provides Efficient Memory Allocation
- Separates Address Space of System and User Resources
- Provides Write Protection
- Supports Paging and Segmentation
- 32 Segments of Variable Size with Each MMU
- Multiple MMU Capability to Expand to Any Number of Segments
- Allows Inter-Task Communication through Shared Segments
- Quick Context Switching to Cut Operating System Overhead
- Simplifies Programming Model of Address Space
- Increases System Reliability
- DMA Compatible
- 6-MHz Version: MC68451L6
- 8-MHz Version: MC68451L8
- 10-MHz Version: MC68451L10

SINGLE-MMU SYSTEM BLOCK DIAGRAM



© IC MASTER 1983

BUS ARBITRATION MODULE

MC68452

The MC68452 bus arbitration module (BAM) is an asynchronous bus controller that allows multiple local buses to be multiplexed onto a common global bus enabling the local buses to share memory, I/O devices, and communicate with each other easily. A single BAM provides arbitration for up to eight local buses and can be expanded indefinitely to support more local buses.

DUAL UNIVERSAL SERIAL COMMUNICATIONS CONTROLLER

MC68562

The MC68562 Dual Universal Serial Communications Controller (DUSCC) is a single-chip MOS-LSI communications device that provides two independent, multiprotocol, full duplex receiver, transmitter channels in a single package. The DUSCC supports bit-oriented and character-oriented (byte count and byte control) synchronous data link controls as well as asynchronous protocols. The logic for both channels provides formats, synchronization, and validation for data transferred to and from the channel interface.

SERIAL INPUT/OUTPUT

MC68564

The MC68564 is a dual-channel serial input/output communication peripheral. It satisfies a wide variety of serial data communication requirements as it handles asynchronous, byte synchronous (bisync), and synchronous bit-oriented protocols (HDLC and SDLC). In addition, it is capable of supporting virtually any serial protocol used in an application other than data communication, such as a floppy disk interface.

MULTI-PROTOCOL COMMUNICATIONS CONTROLLER

MC68652/MC2652

The MC68652/MC2652 MPCC formats, transmits, and receives synchronous serial data while supporting Bit-Oriented (BOP) or Byte-Control (BCP) protocols. The parallel bus of the MPCC readily interfaces with M6800 and M68000 Microprocessor Families as well as many other 8- or 16-bit processors. Typical applications include intelligent terminals, front-end communications, remote-data concentrators, communication test equipment, and computer-to-computer links.

- DC to 2 Mbps Data Rate
- Bit-Oriented Protocols (BOP): SDLC, ADCCP, HDLC, X.25
  - Character Length — 1 to 8 Bits
  - Automatic Detection and Generation of Special Control Characters, i.e., FLAG, ABORT, GA
  - Automatic Zero Insertion and Deletion
  - Idle Transmission of FLAG or ABORT Characters
  - Automatic Generation and Checking of CRC-CCITT FCS
- Byte-Control Protocols (BCP): DDCMP, BISYNC External CRC)
  - Character Length — 5 to 8 Bits
  - SYNC Generation Detection and Stripping
  - Idle Transmission of SYNC or MARK Characters
  - Automatic Generation and Checking of CRC-16 or VRC
- Maintenance Mode for Self-Checking

POLYNOMIAL GENERATOR CHECKER
MC68653/MC2653

The MC68653/MC2653 Polynomial Generator Checker (PGC) is a polynomial generator checker/character comparator circuit that complements a receiver/transmitter (R/T or USART/USRT/UART) in the support of character oriented data-link controls.

Parallel data characters transferred between the MPU and R/T are monitored by the PGC which performs block check character (BCC) and parity (VRC) generation/checking, single character detection, and two character sequence detection. Since the PGC operates on parallel characters, the data transmission format may be serial (synchronous or asynchronous) or parallel.

- Parallel Block Check Character Accumulation/Checking: CRC-16, CRC-12, LRC-8
- BISYNC Normal and Transparent Modes
- Automatic- or Single-Character Accumulation Modes
- Two Character Sequence Detection; Examples: DLE-STX, ACK 0, ACK 1, WACK, RVI, DISC, WBT
- 6-, 7-, or 8-Bit Characters
- VRC Generation/Checking on Data Bus
- Four Maskable Interrupt Conditions
- Maximum Character Accumulation Rate of 500 kHz (4 Mbps)
- No System Clock Required

ENHANCED PROGRAMMABLE COMMUNICATIONS INTERFACE
MC68661/MC2661

The MC2661/MC68661, Enhanced Programmable Communications Interface (EPCI), is a universal synchronous/asynchronous data communications controller chip that is an enhanced version of the Signetics 2651. The EPCI directly interfaces to most 8-bit MPUs and easily to the MC68000 MPU and other 16-bit MPUs. It may be used in either a polled or interrupt driven system. Programmed instructions can be accepted from the host MPU while supporting many synchronous or asynchronous serial-data communication protocols in a full or half-duplex mode. Special support for BISYNC is provided.

The EPCI converts parallel data characters, accepted from the microprocessor data bus, into transmit-serial data. Simultaneously, the EPCI can convert receive-serial data to parallel data characters for input to the microprocessor.

A baud rate generator in the EPCI can be programmed to either accept an external clock, or to generate internal transmit or receive clocks. Sixteen different baud rates can be selected under program control when operating in the internal clock mode. Each version of the EPCI (A, B, C) has a different set of baud rates.

- 3 Baud Rate Sets (A, B, C); 16 Internal Rates for Each Set
- 5- to 8-Bit Characters Plus Parity; Odd, Even, or No Parity
- Double Buffered Transmitter and Receiver
- Dynamic Character Length Switching
- Local or Remote Maintenance Loop-Back Mode
- RxC and TxC Pins and Short Circuit Protected

DUAL ASYNCHRONOUS RECEIVER/TRANSMITTER (DUART)
MC68681

The MC68681 Dual Universal Asynchronous Receiver/Transmitter (DUART) is a single-chip MOS-LSI communications device that provides two independent full-duplex asynchronous receiver/transmitter channels in a single package. It is compatible with other M68000 Family devices, and can also interface easily with other microprocessors. The DUART can be used in polled or interrupt driven systems.

- Quadruple Buffered Receiver Data Registers
- Programmable Data Format
  - 5 to 8 Data Bits Plus Parity
  - Odd, Even, No Parity, or Force Parity
  - 1, 1.5, or 2 Stop Bits Programmable in 1/16 Bit Increments
- Programmable Baud Rate for Each Receiver and Transmitter

MULTI-FUNCTION PERIPHERAL
MC68901

The MC68901 multi-function peripheral (MFP) is a combination of many of the necessary peripheral functions in a microprocessor system. Included are: four timers, interrupt controller for 16 sources, eight parallel I/O lines, and a single-channel USART. The use of the MFP in a system can significantly reduce chip count, thereby reducing system cost. The MFP is completely MC68000 bus compatible with 24 directly addressable internal registers that provide the necessary control and status interface to the programmer.

ADVANCE INFORMATION
JULY 1981

COP410C/COP411C and COP310C/COP311C Fully Static, Single-Chip CMOS Microcontrollers

General Description

The COP410C, COP411C, COP310C, and COP311C fully static, single-chip CMOS microcontrollers are members of the COPS™ family, fabricated using double-poly, silicon gate complementary MOS technology. These microcontrollers are complete microcomputers containing all system timing, internal logic, ROM, RAM, and I/O necessary to implement dedicated control functions in a variety of output configuration options, with an instruction set, internal architecture, and I/O scheme designed to facilitate keyboard input, display output, and BCD data manipulation. The COP411C is identical to the COP410C but with 16 I/O lines instead of 19. They are an appropriate choice for use in numerous human interface control environments. Standard test procedures and reliable high-density fabrication techniques provide the medium to large volume customers with a customized Controller Oriented Processor at a low end product cost.

The COP310C/COP311C are exact functional equivalents, but extended temperature range versions of the COP410C/COP411C.

Features

- Lowest power dissipation (40 μW typical)
- Low cost
- Power saving HALT mode with Continue function
- Powerful instruction set
- 512 × 8 ROM, 32 × 4 RAM
- 19 I/O lines (COP410C)
- Two-level subroutine stack
- DC to 4 μs instruction time
- Single supply operation (2.4V to 5.5V)
- General purpose and TRI-STATE® outputs
- Internal binary counter register with serial I/O capability
- LSTTL/CMOS compatible in and out
- Software/hardware compatible with other members of the COP400 family
- MICROWIRE™ compatible serial I/O
- Extended temperature range device available (−40°C to +85°C)

COPS, TRI-STATE, and MICROWIRE are trademarks of National Semiconductor Corp.

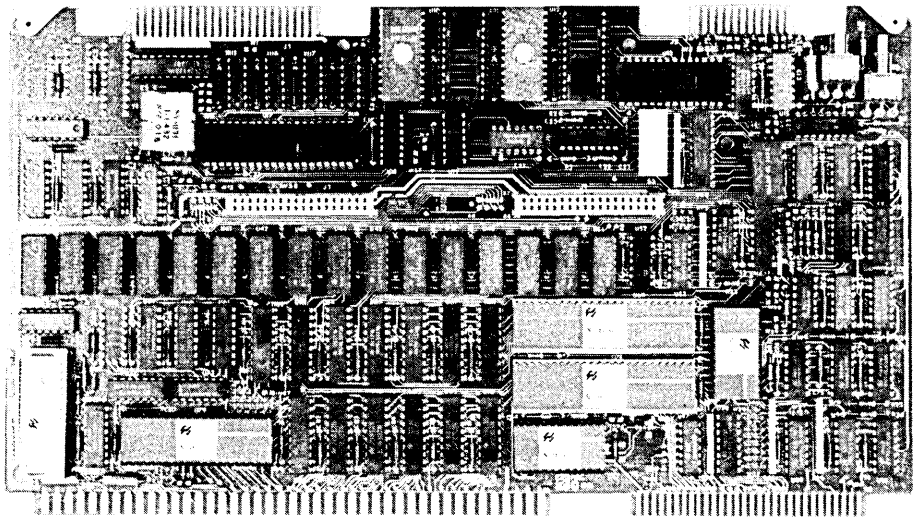
DB16000 Development Board



- **NS16032 microprocessor**
- **32K bytes RAM (expandable to 128K bytes)**
- **8K bytes PROM (expandable to 16K bytes)**
- **Sockets for NS16082 MMU, NS16081 FPU, NS16202 ICU**
- **24 programmable parallel I/O lines**
- **Comprehensive system monitor**
- **Cross software development using NSX16**
- **MULTIBUS™ compatibility for ease of evaluation**
- **RS-232 port for communication to host system and user applications**
- **2 BLX expansion module connectors for additional I/O capability**

Product Overview

The DB16000 Development Board is a complete microcomputer system using the National Semiconductor NS16000 family of advanced microprocessors. The board includes an CPU, support chips, on-board memory, and a wide range of both standard and optional I/O interface devices. A monitor program, residing in on-board PROM, completes the system.

The DB16000 is specifically designed for the development and evaluation of both hardware and software for the NS16032 CPU, related slave processors and support chips. With the DB16000, users can examine the architecture, instruction set, and bus interface of the NS16032.

As a development tool, the DB16000 is a powerful hardware and software debugging aid for the NS16032 CPU. Cross-development software packages allow the DB16000 to be used with the STARPLEX II™ development system or the VAX™ series running under the VMS operating system. The NSX16 cross-support package allows programmers to compile or assemble NS16032 programs, then download them to the DB16000 (via a serial data link) to be executed. High level symbolic debugging is then possible through the DBG16 source level symbolic debugger which is part of NSX16.

Shipped fully assembled, the DB16000 requires only suitable +5 VDC and +/−12 VDC power sources and a data terminal for operation. However, the inherent flexibility and compatibility of the DB16000 allows NS16000 family members to be used in a wide variety of development and evaluation configurations.

© National Semiconductor Corporation (OC1161)

BA-B30M22/Printed in U.S.A.

© IC MASTER 1983

In addition to the MULTIBUS interface, the DB16000 provides a complete pin-out of the CPU address, data and control functions. This permits custom interfacing to a wide range of computer systems.

The standard I/O interface includes an RS-232 compatible serial port and 24 parallel data lines. Also provided on the DB16000 are two connectors that allow BLX expansion modules to be used with the DB16000.

Sockets are provided for mounting optional additional members of the NS16000 family. These include the NS16081 Floating Point Unit, the NS16082 Memory Management Unit, and the NS16202 Interrupt Control Unit. All sockets are fully integrated into the DB16000's printed wiring.

Functional Description

Central Processor

The NS16032 is the central processor for the DB16000. It features a 32-bit internal/16-bit external structure with a very powerful instruction set and programming model designed for high level language support. Support for full virtual memory and high speed IEEE proposed standard floating point operations is available.

Memory

32K bytes of 16K dynamic RAM are provided. By replacing the 16K chips with NMC 4164 64K dynamic RAMs this can be expanded to 128K bytes.

In addition to the two EPROM sockets occupied by the system monitor, two more are provided for user applications programs. Either 2716 or 2732 EPROMs may be used.

Input/Output

Parallel I/O

24 parallel I/O lines are provided via an 8255A Programmable Peripheral Interface. These may be divided into two 8-bit ports and two 4-bit ports. Additional I/O may be obtained by using the BLX expansion connectors.

Serial I/O

The RS-232 serial link is provided via an 8251A Universal Synchronous/Asynchronous Receiver/Transmitter (USART). This link provides for communication with terminals or other computers. The data transmission clocks are generated by the ICU counter/timer if present, making the baud rate programmable. With only the ICU emulator installed, it is set at 9600 baud. Additional I/O may be obtained by using the BLX expansion connectors.

Timers

With the NS16202 Interrupt Control Unit installed there is one 16-bit timer available to the user and one dedicated to the USART. The emulator board, when installed, is dedicated to the USART.

Connectors

There are five connectors available;

1 System bus expansion (for custom boards) (P2)

1 RS-232 port (J2)

1 24 Parallel I/O lines (J1)

2 BLX sockets for I/O expansion (J3, J4)

DB16000 Monitor

The monitor program enables the user to load, execute and debug programs. It has the following features:

— Examine/Change Registers/Memory
— Block Move/Load/Print memory locations
— Search for/Fill block of data
— Insert multiple breakpoints
— Start program and break after a specified number of instructions
— Step for specified number of instructions
— Step until (while) a specified condition is reached

The following additional debug features may also be implemented with the Memory Management Unit (MMU) present:

— Break on memory read and/or write (virtual or physical)
— Break on non-sequential instruction fetch
— Show last 2 non-sequential instruction addresses fetched and the number of instructions executed after each nonsequential fetch

Modes of Operation

There are three main modes of operation; stand alone, stand aside and transparent. In the first mode debugging facilities are available through the monitor, while in the other two modes an assembler, debugger, linker, librarian and Pascal compiler resident on host system give the user a more efficient means of developing programs.

Additional memory and/or I/O may be added by using MULTIBUS compatible cards.

NSC800 High-Performance Low-Power Microprocessor

General Description

The NSC800 is an 8-bit microprocessor that functions as the central processing unit (CPU) in National Semiconductor's NSC800 microcomputer family. The device is fabricated using National's P²CMOS™ technology. This technology provides the system designer with devices that equal the performance levels of comparable NMOS products, combined with the low-power advantages of CMOS. Many system functions are incorporated on the device, such as: vectored priority interrupts, refresh control, power-save feature and interrupt acknowledge. The NSC800 is housed in a 40-pin, dual-in-line package. A ceramic leadless carrier (ED) package is also available.

Dedicated memories (NSC810 RAM-I/O Timer and NSC830 ROM-I/O) have on-chip logic for direct interface to the NSC800. In addition, National also offers a full line of P²CMOS and CMOS components to allow a full low-power solution to system designs.

Z80™ is a registered trademark of Zilog Corp.
TRI-STATE is a registered trademark of National Semiconductor Corp.
P²CMOS is a trademark of National Semiconductor Corp.

Features

- Single 5V Power Supply
- Fully Compatible with Z80™ Instruction Set
- Powerful Set of 158 Instructions
- 10 Addressing Modes
- 22 Internal Registers
- Low Power: 50mW at 5V V_{CC}
- Multiplexed Bus Structure
- On-Chip Bus Controller and Clock Generator
- On-Chip 8-Bit Dynamic RAM Refresh Circuitry
- Speed: 1.6μs Instruction Cycle at 2.5MHz; NSC800-2 2MHz; NSC800-1 1MHz
- Fast Version (NSC800-4): 1μs Instruction Cycle at 4MHz (Availability to be Announced)
- Capable of Addressing 64K Bytes of Memory and 256 I/O devices
- Five Interrupt Request Lines On-Chip
- Schmitt Trigger Input on Reset
- Unique Standby-Current (Power Save) Feature

NSC810 RAM-I/O-Timer

General Description

The NSC810 is a RAM-I/O-Timer device contained in a standard 40-pin, dual-in-line package. The chip, which is fabricated using P²CMOS silicon gate technology, functions as a memory, an input/output peripheral interface and a timing device. The memory is comprised of 1024 bits of static RAM organized as 128 x 8. The I/O portion consists of 22 programmable input/output bits arranged as three separate ports, with each bit individually definable as an input or output. The port bits can be set or cleared individually and can be written or read in bytes. Several types of strobed mode operations are available through Port A. The timer portion of the device consists of two programmable 16-bit binary down-counters each capable of operation in any one of six modes. Timer counts are extendable by one of the available prescale values.

Features

- 128 x 8 Random Access Memory
- Three Programmable I/O Ports
- Two 16-Bit Programmable Counter/Timers
- Single 5V Power Supply
- Very Low Power Consumption
- Fully Static Operation
- Single-Instruction I/O Bit Operations
- Timer Operation — DC to 4MHz
- Directly Compatible with NSC800 Family

NSC830 ROM-I/O; NSC831 I/O Only

General Description

The NSC830 is a ROM-I/O device contained in a standard 40-pin, dual-in-line package. The chip, which is fabricated using P²CMOS silicon gate technology, functions as a memory, and an input/output peripheral interface device. The memory is comprised of 16,384 bits of ROM organized as 2048 x 8. The I/O portion consists of 20 programmable input/output bits arranged as three separate ports, with each bit individually definable as an input or output. The port bits can be set or cleared individually and can be written to or read from in bytes. Several types of strobed mode operations are available through Port A.

The NSC831 I/O Only is similar to the NSC830 except it has no ROM. The NSC831 is useful for prototyping work prior to ordering the NSC830, and when on-chip ROM is not required.

Features

- 2K x 8 Read Only Memory
- Three Programmable I/O Ports
- Single 5V Power Supply
- Very Low Power Consumption
- Fully Static Operation
- Single-Instruction I/O Bit Operations
- Directly Compatible with NSC800 Family
- Strobed Modes Available on Port A

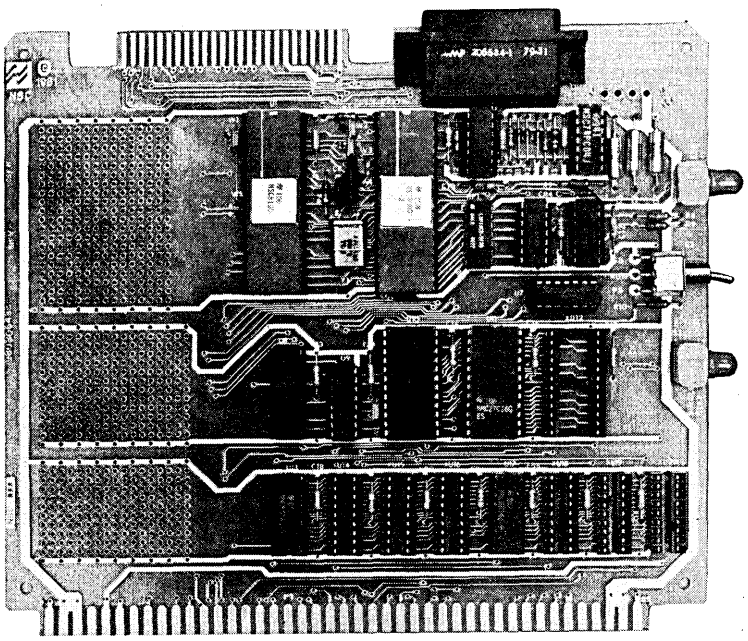
NSC888

NSC800 Evaluation Board



Features

- NSC800 8-Bit P²CMOS™ CPU
- Executes Z80™ Instruction Set
- 20 Programmable Parallel I/O Lines
- Two 16-Bit Programmable Counters/Timers
- Powerful 2K x 8 Monitor Program
- Five Levels of Vectored Prioritized Interrupts
- RS232 Interface
- 1K x 8 P²CMOS RAM with Sockets for up to 4K x 8 RAM
- Socket for additional 2K x 8, 2716 Compatible Memory Component
- Wire Wrap Area
- Edge Connectors for System Expansion
- Single-Step Operation Mode
- Fully Assembled and Tested

Product Overview

The NSC888 is a self-contained microprocessor board which enables the user to quickly evaluate the performance and features of the NSC800 product family. This fully assembled, tested board requires only the addition of a ±5V supply and an RS232 interface cable to the users terminal to begin NSC800 evaluation.

A powerful system monitor is provided on the board which controls serial communications via the RS232 port. The monitor also includes command functions to load, execute and debug NSC800 programs.

The board includes an NSC800 CPU plus RAM, EPROM, I/O, Timers and interface components yet draws only 30mA from the +5V supply and 3mA from the -5V supply.

Although designed primarily as an assessment vehicle, the NSC888 can be readily programmed and adapted to a variety of uses. Wire wrap area is provided on-board for the user to build up additional circuitry or interfaces, thus tailoring this high-performance, low-power microprocessor board to meet individual needs.

P²CMOS is a trademark of National Semiconductor Corp.

Z80 is a trademark of Zilog Corp.

Functional Description

Figure 1 and *Figure 2* provide information on the organization of the NSC888 board. Please refer to these figures for the following discussion.

Central Processor

The powerful NSC800 is the central processor for the NSC888. It provides bus control, clock generation and extensive interrupt capability. Featuring a multiplicity of programmable registers and sophisticated addressing modes, the NSC800 executes the Z80 instruction set.

Memory

- 128 bytes of RAM are provided by the NSC810 RAM-I/O-Timer and are used by the monitor program for the system stack.
- 1024 bytes of RAM are provided by two 1K x 4 NMC6514's. Sockets are provided for six additional NMC6514's, for a total of 4K bytes of RAM.
- A 2K byte EPROM system monitor is provided on-board which includes facilities to load, execute and debug a users program.
- An additional EPROM socket is also on-board which accepts a 2K byte 2716 compatible memory component.

Input/Output

- **Parallel I/O**
  The NSC888 provides 20 programmable parallel I/O lines implemented using the I/O ports of the NSC810 RAM-I/O-Timer. The port bits may be individually defined as input or output, and can also be written to or read from in bytes. The I/O lines are conveniently brought to a 50 contact edge connector for user interface.
- **Serial I/O**
  An RS232 connector and accompanying support circuitry are provided on-board. Two I/O lines from the NSC810 RAM-I/O-Timer are used for the serial communications function, which is controlled exclusively by software. The baud rate is determined upon system initialization by the character bit rate from the users terminal. The maximum baud rate is 2400 baud.

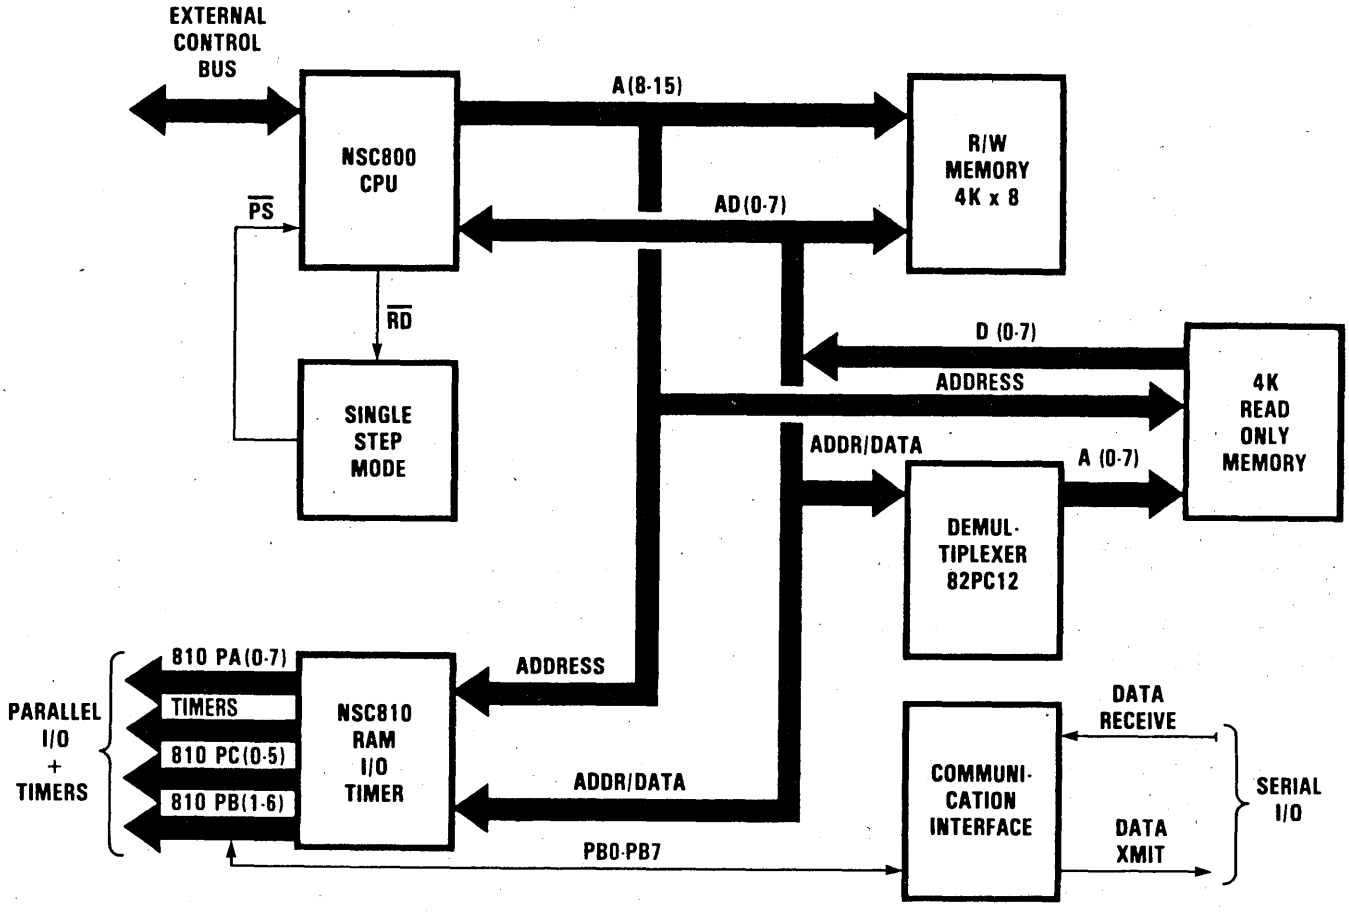

FIGURE 1. NSC888 Functional Block Diagram

SR-O/C/1356-13

© IC MASTER 1983

Timers

The NSC888 provides two fully programmable binary 16-bit counters/timers utilizing the NSC810 RAM-I/O-Timer. These signals are also brought to the parallel I/O connector. Each timer may operate in any of six different modes:

- Event Counter
- Accumulative Timer
- Restartable Timer
- One Shot
- Square Wave
- Pulse Generator

Connectors

- **Parallel I/O**
  The parallel I/O lines and timer lines from the NSC810 RAM-I/O-Timer, plus interrupt lines from the CPU are brought to this 50 contact edge connector.

- **System Bus**
  All NSC800 CPU lines except XIN are brought to this 86 contact edge connector. In addition, the -5V line is also brought to the system bus connector.

- **RS232**
  This connector is provided for system interface to the users terminal.

Interrupts

The NSC888 utilizes the powerful interrupt processing capability of the NSC800 CPU. Interrupts are routed via a jumper matrix to the five interrupt inputs of the NSC800. Each input, which may be from the NSC810 I/O ports, NSC810 timers or off board via the system bus connector, generates a unique memory address (see *Table 1*). All interrupts with the exception of NMI can be masked via software. Interrupt lines are also brought to the parallel I/O connector.

Table 1.

Interrupt Input	Memory Address	Type	Priority
NMI	0066H	Non-maskable	Highest
RSTA	003CH	Maskable	
RSTB	0034H	Maskable	
RSTC	002CH	Maskable	
INTR	0038H*	Maskable	Lowest

*mode 1

NSC888 FIRMWARE

The NSC888 system monitor is provided by a pre-programmed EPROM. This comprehensive monitor includes facilities to load, execute and debug programs. The monitor allows the user to examine and modify any RAM memory location or CPU register. It permits the insertion of break points to facilitate debugging. Programs can be executed starting at any location. The commands supported by the NSC888 system monitor are as follows:

- B - Select a new baud rate
- D - Display memory
- F - Fill memory between ranges
- G - Execute program with break points
- H - Hexadecimal math routine
- J - Non-destructive memory test
- K - Store 16-bit value in memory
- M - Move a block of data
- P - Put ASCII characters in memory
- Q - Query I/O ports
- S - Substitute and/or examine memory
- T - Type memory contents in ASCII
- V - Verify two blocks of data
- X - Examine or modify CPU registers
- Y - Memory search for string

These commands are fully explained in the NSC888 Hardware/Software Users Manual.

Single Step/Power Save

The NSC888 provides a unique single-step mode, utilizing the Power Save input of the NSC800 CPU. This input, when activated, reduces CPU power consumption from 50mW to only 25mW. It also allows the user to single-step through a program, checking and modifying code. This function is controlled via a switch on the board.

Specifications

Microprocessor

CPU-	NSC800
Data Word-	8 bits
Instruction Word-	8, 16, 24, 32 bits
Cycle Time-	2.00μs (minimum instruction time)
System Clock-	2.00MHz
Registers-	14 general purpose (8-bit) 2 index registers (16-bit) 1 stack pointer (16-bit) 1 program counter (16-bit)
Number of Instructions-	158
Address Capability-	64K bytes

Memory

RAM-	1152 bytes on-board plus sockets for an additional 3K bytes
ROM/EPROM-	Sockets for 4K bytes on-board
Access Time-	625ns for opcode fetch 875ns for memory read

Connectors

System Bus-	86-pin double-sided card cage edge connector on 0.156 inch centers

© IC MASTER 1983

Parallel I/O-	50-pin double-sided edge connector on 0.1 inch centers Recommended mating connector: 3M 3415-0001 AMP 2-86792-3
Serial I/O-	Standard RS232 connector
Power	+5V 30mA (27C16 EPROM monitor) or 90mA (2716 EPROM monitor) -5V 3mA
Physical	
Height-	6.75 (17.15cm)
Width-	7.85 (19.94cm)

Order Information

NSC888-	Includes CPU, 1152 bytes of RAM, sockets for additional 3K bytes of RAM, 2K byte monitor with additional socket for 2K byte ROM/EPROM, 20 I/O lines, RS232 interface, wire wrap area.
Documentation-	The NSC888 Hardware/ Software Users Manual and NSC800 Microprocessor Family Handbook are shipped with the NSC888 Evaluation Board

LIFE SUPPORT POLICY:

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user.

2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

NS16032-6 High-Performance Microprocessor

General Description

The NS16032-6 functions as a central processing unit (CPU) in National Semiconductor's NS16000 microcomputer family. It has been designed to optimally support microprocessor users who need the ability to use a large addressing space for large programs and/or large data structures. Because large programs must realistically be generated and maintained in high-level languages, the NS16000 architecture provides for very efficient compilation while remaining easy to program at the assembler level for optimizations. Full virtual memory capability is provided in conjunction with the NS16082 Memory Management Unit (MMU). High performance floating-point instructions are provided with the NS16081 Floating-Point Unit (FPU).

Features

- 32-bit Architecture and Implementation
- 16-MByte Uniform Addressing Space
- Powerful Instruction Set
  - — General 2-Address Capability
  - — Very High Degree of Symmetry
  - — Addressing Modes Optimized for High-Level Language References
  - — Expansion via Slave Processors or Traps
- High-Speed XMOS Technology
- Single 5V Supply
- 48-pin Dual-In-Line Package

1 NS16032 Pin Descriptions

The following is a brief description of all NS16032 pins. The descriptions reference portions of the Functional Description, Section 3.

1.1 SUPPLIES

Power (V_{CC}): +5V Positive Supply. Sec. 3.1.

Logical Ground (GNDL): Ground reference for on-chip logic. Sec. 3.1.

Buffer Ground (GNDB): Ground reference for on-chip drivers connected to output pins. Sec. 3.1.

Back-Bias Generator (BBG): Output of on-chip substrate voltage generator. Sec. 3.1.

1.2 INPUT SIGNALS

Clocks (PHI1, PHI2): Two-phase clocking signals. Sec. 3.2.

Ready (RDY): Active high. While RDY is inactive, the CPU extends the current bus cycle to provide for a slower memory or peripheral reference. Upon detecting RDY active, the CPU terminates the bus cycle. Sec. 3.4.1.

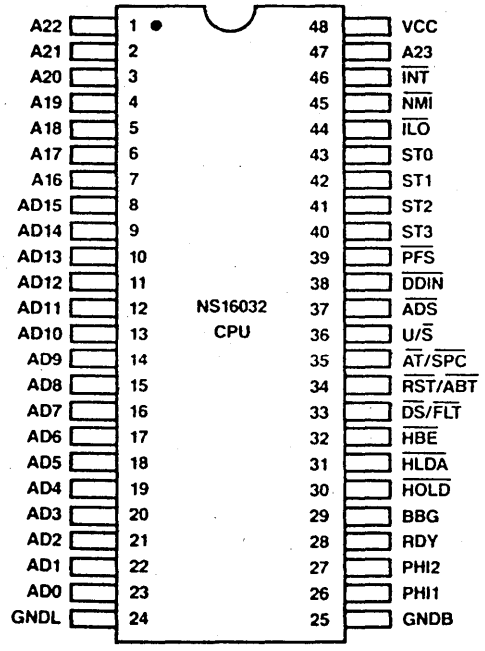
Hold Request ($\overline{HOLD}$): Active low. Causes the CPU to release the bus for DMA or multiprocessing purposes. Sec. 3.6.

Interrupt ($\overline{INT}$): Active low. Maskable Interrupt request. Sec. 3.8.

Non-Maskable Interrupt ($\overline{NMI}$): Active low. Non-Maskable Interrupt request. Sec. 3.8.

Reset/Abort ($\overline{RST}/\overline{ABT}$): Active low. If held active for one clock cycle and released, this pin causes an Abort Command, Sec. 3.5.4. If held longer, it initiates a Reset Sec. 3.3.

Pin Configuration



1.3 OUTPUT SIGNALS

Address Bits 16-23 (A16-A23): Active high. These are the most significant 8 bits of the memory address bus. Sec. 3.4.

Address Strobe ($\overline{ADS}$): Active low. Controls address latches; indicates start of a bus cycle. Sec. 3.4.

Data Direction In ($\overline{DDIN}$): Active low. Status signal indicating direction of data transfer during a bus cycle. Sec. 3.4.

High Byte Enable ($\overline{HBE}$): Active low. Status signal enabling transfer on the most-significant byte of the Data Bus. Sec. 3.4; Sec. 3.4.3.

Status (ST0-ST3): Active high. Bus cycle status code, ST0 least significant. Sec. 3.4.2. Encodings are:

0000 — Idle: CPU Inactive on Bus.
0001 — Idle: WAIT Instruction.
0010 — (Reserved)
0011 — Idle: Waiting for Slave.
0100 — Interrupt Ack., Master.
0101 — Interrupt Ack., Cascaded.
0110 — End of Interrupt, Master.
0111 — End of Interrupt, Cascaded.
1000 — Sequential Instruction Fetch.
1001 — Non-Sequential Instruction Fetch.
1010 — Data Transfer.
1011 — Read RMW Operand.
1100 — Read for Effective Address.
1101 — Transfer Slave Operand.
1110 — Read Slave Status Word.
1111 — Broadcast Slave ID.

Hold Acknowledge ($\overline{HLDA}$): Active low. Applied by the CPU in response to $\overline{HOLD}$ input, indicating that the bus has been released for DMA or multiprocessing purposes. Sec. 3.6.

User/Supervisor (U/$\overline{S}$): User or Supervisor Mode status. Sec. 3.7. High state indicates User Mode, low indicates Supervisor Mode. Sec. 3.7.

Interlocked Operation ($\overline{ILO}$): Active low. Indicates that an interlocked instruction is being executed. Sec. 3.7.

Program Flow Status ($\overline{PFS}$): Active low. Pulse indicates beginning of an instruction execution. Sec. 3.7.

1.4 INPUT-OUTPUT SIGNALS

Address/Data 0-15 (AD0-AD15): Active high. Multiplexed Address/Data information. Bit 0 is the least significant bit of each. Sec. 3.4.

Address Translation / Slave Processor Control ($\overline{AT}$/$\overline{SPC}$): Active low. Used by the CPU as the data strobe output for Slave Processor transfers; used by Slave Processors to acknowledge completion of an instruction. Sec. 3.4.6; Sec. 3.9. Sampled on trailing edge of Reset pulse as Address Translation Strap. Sec. 3.5.1.

Data Strobe/Float ($\overline{DS}/\overline{FLT}$): Active low. Data Strobe output, Sec. 3.4, or Float Command input, Sec. 3.5.3. Pin function is selected on $\overline{AT}/\overline{SPC}$ pin, Sec. 3.5.1.

2 Architectural Description

2.1 PROGRAMMING MODEL

The NS16000 architecture includes 16 registers on the NS16032 CPU.

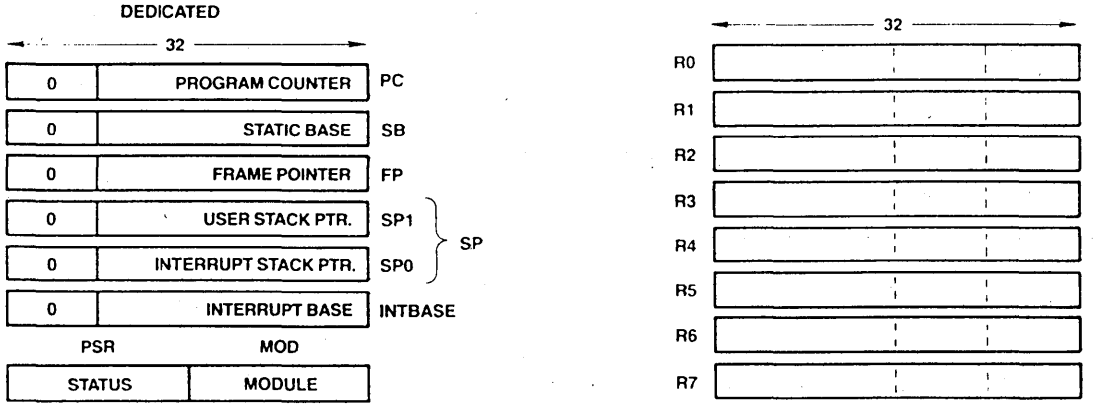

FIGURE 2-1. The General and Dedicated Registers.

2.1.1 General Purpose Registers

There are eight registers for meeting high speed general storage requirements, such as holding temporary variables and addresses. The general purpose registers are free for any use by the programmer. They are thirty-two bits in length. If a general register is specified for an operand which is eight or sixteen bits long, only the low part of the register is used; the high part is not referenced or modified.

2.1.2 Dedicated Registers

The eight dedicated registers of the NS16032 are assigned specific functions.

PC: The PROGRAM COUNTER register is a pointer to the first byte of the instruction currently being executed. The PC is used to reference memory in the program section. (In the NS16032 the upper eight bits of this register are always zero.)

SP0, SP1: The SP0 register points to the lowest address of the last item stored on the INTERRUPT STACK. This stack is normally used only by the operating system. It is used primarily for storing temporary data, and holding return information for operating system subroutines and interrupt and trap service routines. The SP1 register points to the lowest address of the last item stored on the USER STACK. This stack is used by normal user programs to hold temporary data and subroutine return information.

In this document, reference is made to the SP register. The terms "SP register" or "SP" refer to either SP0 or SP1, depending on the setting of the S bit in the PSR register. If the S bit in the PSR is 0 then SP refers to SP0. If the S bit in the PSR is 1 then SP refers to SP1. (In the NS16032 the upper eight bits of these registers are always zero).

Stacks in the NS16000 family grow downward in memory. A Push operation pre-decrements the Stack Pointer by the operand length. A Pop operation post-increments the Stack Pointer by the operand length.

FP: The FRAME POINTER register is used by a procedure to access parameters and local variables on the stack. The FP register is set up on procedure entry with the ENTER instruction and restored on procedure termination with the EXIT instruction.

The frame pointer holds the lowest address in memory occupied by the old contents of the frame pointer. (In the NS16032 the upper eight bits of this register are always zero.)

SB: The STATIC BASE register points to the global variables of a software module. This register is used to support relocatable global variables for software modules. The SB register holds the lowest address in memory occupied by the global variables of a module. (In the NS16032 the upper eight bits of this register are always zero.)

INTBASE: The INTERRUPT BASE register holds the address of the dispatch table for interrupts and traps (Sec. 3.8). The INTBASE register holds the lowest address in memory occupied by the dispatch table. (In the NS16032 the upper eight bits of this register are always zero.)

MOD: The MODULE register holds the address of the module descriptor of the currently executing software module. The MOD register is sixteen bits long, therefore the module table must be contained within the first 64K bytes of memory.

PSR: The PROCESSOR STATUS REGISTER (PSR) holds the status codes for the NS16032 microprocessor.

The PSR is sixteen bits long, divided into two eight-bit halves. The low order eight bits are accessible to all programs, but the high order eight bits are accessible only to programs executing in Supervisor Mode.

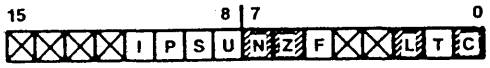

FIGURE 2-2. The Processor Status Register.

© IC MASTER 1983

C: The C bit indicates that a carry or borrow occurred after an addition or subtraction instruction. It is used in the calculation of multiple precision numbers. It may have a setting of 0 (no carry or borrow) or 1 (carry or borrow).

T: The T bit causes program tracing. If this bit is a 1, a TRC trap is executed after every instruction (Sec. 3.8.5).

L: The L bit is altered by comparison instructions. In a comparison instruction the L bit is set to "1" if the second operand is less than the first operand, when both operands are interpreted as unsigned integers. Otherwise, it is set to "0". In Floating Point comparisons, this bit is always cleared.

F: The F bit is a general condition flag, which is altered by many instructions (e.g., integer arithmetic instructions use it to indicate overflow).

Z: The Z bit is altered by comparison instructions. In a comparison instruction the Z bit is set to "1" if the second operand is equal to the first operand; otherwise it is set to "0".

N: The N bit is altered by comparison instructions. In a comparison instruction the N bit is set to "1" if the second operand is less than the first operand, when both operands are interpreted as signed integers. Otherwise, it is set to "0".

U: If the U bit is "1" no privileged instructions may be executed. If the U bit is "0" then all instructions may be executed. When U = 0 the NS16032 is said to be in Supervisor Mode; when U = 1 the NS16032 is said to be in User Mode. A User Mode program is restricted from executing certain instructions and accessing certain registers which could interfere with the operating system. For example, a User Mode program is prevented from changing the setting of the flag used to indicate its own privilege mode. A Supervisor Mode program is assumed to be a trusted part of the operating system, hence it has no such restrictions.

S: The S bit specifies whether the SP0 register or SP1 register is used as the stack pointer. The bit is automatically cleared on interrupts and traps. It may have a setting of 0 (use the SP0 register) or 1 (use the SP1 register).

P: The P bit prevents a TRC trap from occurring more than once for an instruction (Sec. 3.8.5). It may have a setting of 0 (no trace pending) or 1 (trace pending).

I: If I = 1, then all interrupts will be accepted (Sec. 3.8). If I = 0, only the NMI interrupt is accepted. Trap enables are not affected by this bit.

2.1.3 The Configuration Register (CFG)

Within the Control section of the NS16032 CPU is the four-bit CFG Register, which declares the presence of certain external devices. It is referenced by only one instruction, SETCFG, which is intended to be executed only as part of system initialization after reset. The format of the CFG Register is shown in Figure 2-3.

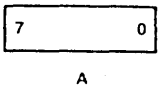
FIGURE 2-3. CFG Register.

The CFG I bit declares the presence of external interrupt vectoring circuitry (specifically, the NS16202 Interrupt Control Unit). If the CFG I bit is set, interrupts requested through the $\overline{INT}$ pin are "Vectored." If it is clear, these interrupts are "Non-Vectored." See Sec. 3.8.

The F, M and C bits declare the presence of the FPU, MMU and Custom Slave Processors. If these bits are not set, the corresponding instructions are trapped as being undefined.

2.1.4 Memory Organization

The main memory of the NS16032 is a uniform linear address space. Memory locations are numbered sequentially starting at zero and ending at $2^{24} - 1$. The number specifying a memory location is called an address. The contents of each memory location is a byte consisting of eight bits. Unless otherwise noted, diagrams in this document show data stored in memory with the lowest address on the right and the highest address on the left. Also, when data is shown vertically, the lowest address is at the top of a diagram and the highest address at the bottom of the diagram. When bits are numbered in a diagram, the least significant bit is given the number zero, and is shown at the right of the diagram. Bits are numbered in increasing significance and toward the left.



Byte at Address A

Two contiguous bytes is called a word. Except where noted (Sec. 2.2.1), the least significant byte of a word is stored at the lower address, and the most significant byte of the word is stored at the next higher address. In memory, the address of a word is the address of its least significant byte, and a word may start at any address.

Word at Address A

Two contiguous words is called a double word. Except where noted (Sec. 2.2.1), the least significant word of a double word is stored at the lowest address and the most significant word of the double word is stored at the address two greater. In memory, the address of a double word is the address of its least significant byte, and a double word may start at any address.

Double Word at Address A

Although memory is addressed as bytes, it is actually organized as words. Therefore, words and double words which are aligned to start at addresses which are even (multiples of two) are accessed more quickly than words and double words which are not so aligned.

© IC MASTER 1983

2.1.5 Dedicated Tables

Two of the NS16032 dedicated registers (MOD and INTBASE) serve as pointers to dedicated tables in memory.

The INTBASE register points to the Interrupt Dispatch and Cascade tables. These are described in Sec. 3.8.

The MOD register contains a pointer into the Module Table, whose entries are called Module Descriptors. A Module Descriptor contains four pointers, three of which are used by the NS16032. At any point in time, the MOD register contains the address of the Module Descriptor for the currently running module. It is automatically updated by the Call External Procedure instructions (CXP and CXPD).

The format of a Module Descriptor is shown in Figure 2-4. The Static Base entry contains the address of static data which is assigned to the running module. It is loaded into the CPU Static Base register by the CXP and CXPD instructions. The Program Base entry contains the address of the first byte of instruction code in the module. Since a module may have multiple entry points, the Program Base pointer serves only as a reference to find them.

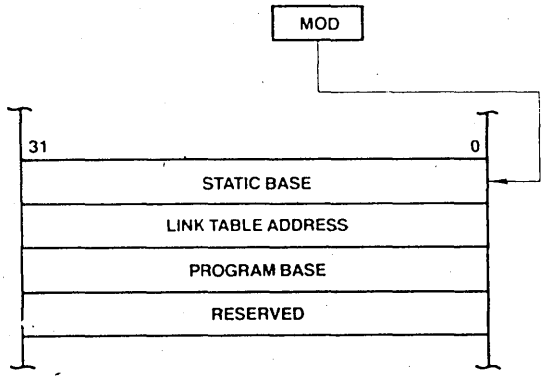


FIGURE 2-4. Module Descriptor Format.

The Link Table Address points to the Link Table for the currently running module. The Link Table provides the information which is needed for:

1) Sharing variables between modules. Such variables are accessed through the Link Table via the External addressing mode.
2) Transferring control from one module to another. This is done via the Call External Procedure (CXP) instruction.

The format of a Link Table is given in Figure 2-5. A Link Table Entry for an external variable contains the 32-bit address of that variable. An entry for an external procedure contains two 16-bit fields: Module and Offset. The Module field contains the new MOD register contents for the module being entered. The Offset field is an unsigned number giving the position of the entry point relative to the new module's Program Base pointer.

For further details of the functions of these tables, see the NS16000 Programmer's Manual.

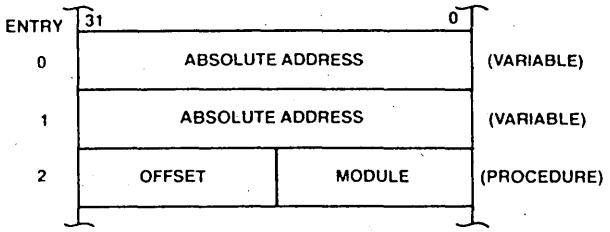

FIGURE 2-5. A Sample Link Table.

2.2 INSTRUCTION SET

2.2.1 General Instruction Format

Figure 2-6 shows the general format of an NS16000 instruction. The Basic Instruction is one to three bytes long and contains the Opcode and up to two 5-bit General Addressing Mode ("Gen") fields. Following the Basic Instruction field is a set of optional extensions, which may appear depending on the instruction and the addressing modes selected.

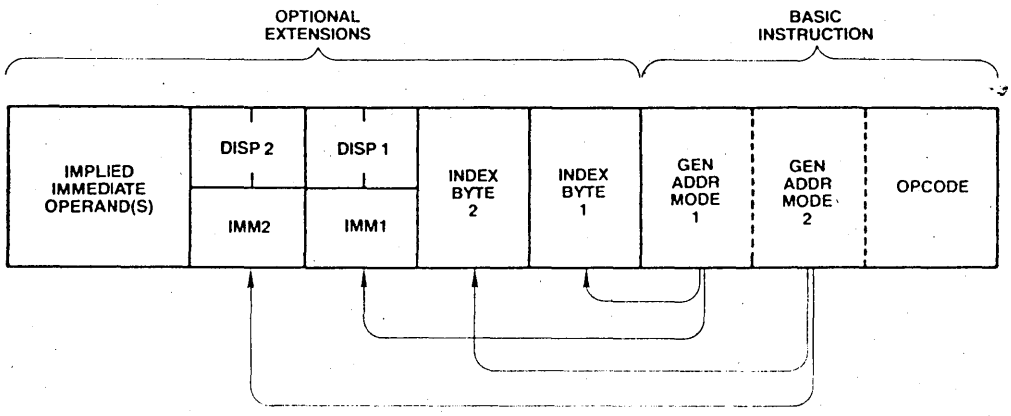

FIGURE 2-6. General Instruction Format.

© IC MASTER 1983

Index Bytes appear when either or both Gen fields specify Scaled Index. In this case, the Gen field specifies only the Scale Factor (1, 2, 4 or 8), and the Index Byte specifies which General Purpose Register to use as the index, and which addressing mode calculation to perform before indexing. See Figure 2-7.

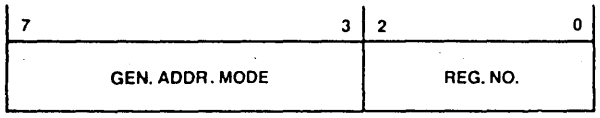

FIGURE 2-7. Index Byte Format.

Following Index Bytes come any displacements (addressing constants) or immediate values associated with the selected addressing modes. Each Disp/Imm field may contain one or two displacements, or one immediate value. The size of a Displacement field is encoded within the top bits of that field, as shown in Figure 2-8, with the remaining bits interpreted as a signed (two's complement) value. The size of an immediate value is determined from the Opcode field. Both Displacement and Immediate fields are stored most-significant byte first. Note that this is backward from the usual memory representation of data (Sec. 2.1.4).

Some instructions require additional, "implied" immediates and/or displacements, apart from those associated with addressing modes. Any such extensions appear at the end of the instruction, in the order that they appear within tne list of operands in the instruction definition (Sec. 2.2.3).

2.2 2 Addressing Modes

The NS16032 CPU generally accesses an operand by calculating its Effective Address based on information available when the operand is to be accessed. The method to be used in performing this calculation is specified by the programmer as an "addressing mode."

Addressing modes in the NS16032 are designed to optimally support high-level language accesses to variables. In nearly all cases, a variable access requires only one addressing mode, within the instruction which acts upon that variable. Extraneous data movement is therefore minimized.

NS16032 Addressing Modes fall into nine basic types:

Register: The operand is available in one of the eight General Purpose Registers. In certain Slave Processor instructions, an auxiliary set of eight registers may be referenced instead.

Register Relative: A General Purpose Register contains an address to which is added a displacement value from the instruction, yielding the Effective Address of the operand in memory.

Memory Space: Identical to Register Relative above, except that the register used is one of the dedicated registers PC, SP, SB or FP. These registers point to data areas generally needed by high-level languages.

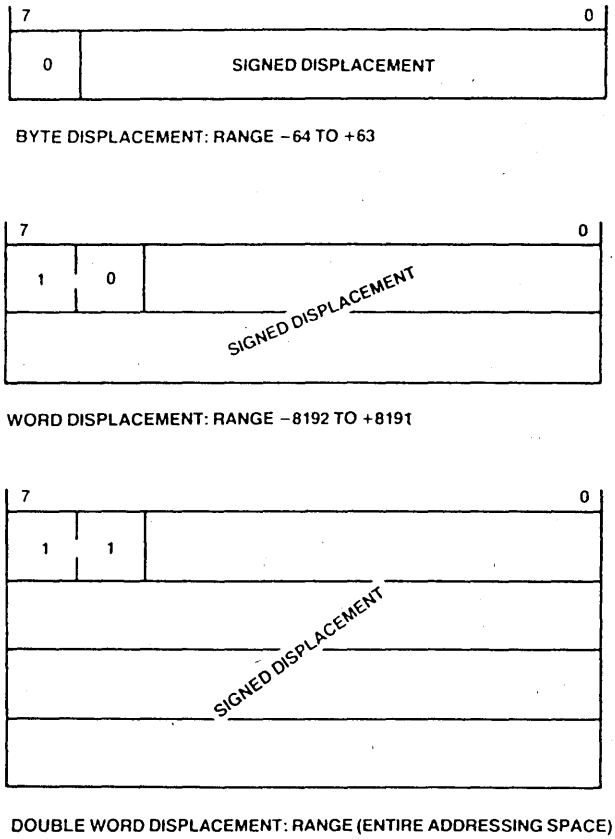

FIGURE 2-8. Displacement Encodings.

Memory Relative: A pointer variable is found within the memory space pointed to by the SP, SB or FP register. A displacement is added to that pointer to generate the Effective Address of the operand.

Immediate: The operand is encoded within the instruction. This addressing mode is not allowed if the operand is to be written.

Absolute: The address of the operand is specified by a displacement field in the instruction.

External: A pointer value is read from a specified entry of the current Link Table. To this pointer value is added a displacement, yielding the Effective Address of the operand.

Top of Stack: The currently-selected Stack Pointer (SP0 or SP1) specifies the location of the operand. The operand is pushed or popped, depending on whether it is written or read.

Scaled Index: Although encoded as an addressing mode, Scaled Indexing is an option on any addressing mode except Immediate or another Scaled Index. It has the effect of calculating an Effective Address, then multiplying any General Purpose Register by 1, 2, 4 or 8 and adding it into the total, yielding the final Effective Address of the operand.

The following table, Table 2-1, is a brief summary of the addressing modes. For a complete description of their actions, see the Programmer's Manual.

© IC MASTER 1983

2.2.3 Instruction Set Summary

This section presents a brief description of the NS16032 instruction set. The Format column of each table is a reference into the Instruction Format tables (Appendix A). The Instruction column gives the instruction as coded in assembly language, and the Description column provides a short description of the function provided by that instruction. Further details of the exact operations performed by each instruction may be found in the Programmer's Manual.

Notations:

i = Integer length suffix: B = Byte
W = Word
D = Double Word

f = Floating Point length suffix: F = Standard Floating
L = Long Floating

gen = General operand. Any addressing mode can be specified.

short = A 4-bit value encoded within the Basic Instruction.

imm = Implied immediate operand. An 8-bit value appended after any addressing extensions.

disp = Displacement (addressing constant): 8, 16 or 32 bits. All three lengths legal.

reg = Any General Purpose Register: R0-R7.

areg = Any Dedicated/Address Register: SP, SB, FP, MOD, INTBASE, PSR, US (bottom 8 PSR bits).

mreg = Any Memory Management Status/Control Register.

creg = A Custom Slave Processor Register (Implementation Dependent).

cond = Any condition code, encoded as a 4-bit field within the Basic Instruction.

TABLE 2-1.
NS16032 Addressing Modes

ENCODING	MODE	ASSEMBLER SYNTAX	EFFECTIVE ADDRESS
Register			
00000	Register 0	R0 or F0	None: Operand is in the specified register.
00001	Register 1	R1 or F1	
00010	Register 2	R2 or F2	
00011	Register 3	R3 or F3	
00100	Register 4	R4 or F4	
00101	Register 5	R5 or F5	
00110	Register 6	R6 or F6	
00111	Register 7	R7 or F7	
Register Relative			
01000	Register 0 relative	disp(R0)	Disp + Register.
01001	Register 1 relative	disp(R1)	
01010	Register 2 relative	disp(R2)	
01011	Register 3 relative	disp(R3)	
01100	Register 4 relative	disp(R4)	
01101	Register 5 relative	disp(R5)	
01110	Register 6 relative	disp(R6)	
01111	Register 7 relative	disp(R7)	
Memory Space			
11000	Frame memory	disp(FP)	Disp + Register; "SP" is either SP0 or SP1, as selected in PSR.
11001	Stack memory	disp(SP)	
11010	Static memory	disp(SB)	
11011	Program memory	disp(PC)	
Memory Relative			
10000	Frame memory relative	disp2(disp1(FP))	Disp2 + Pointer; Pointer found at address Disp1 + Register. "SP" is either SP0 or SP1, as selected in PSR.
10001	Stack memory relative	disp2(disp1(SP))	
10010	Static memory relative	disp2(disp1(SB))	
Immediate			
10100	Immediate	value	None: Operand is input from instruction queue.
Absolute			
10101	Absolute	@disp	Disp.
External			
10110	External	EXTERNAL (disp1)+disp2	Disp2 + Pointer; Pointer is found at Link Table Entry number Disp1.
Top of Stack			
10111	Top of stack	TOS	Top of current stack, using either User or Interrupt Stack Pointer, as selected in PSR. Automatic Push/Pop included.
Scaled Index			
11100	Index, bytes	mode[Rn:B]	Mode + Rn.
11101	Index, words	mode[Rn:W]	Mode + 2×Rn.
11110	Index, double words	mode[Rn:D]	Mode + 4×Rn.
11111	Index, quad words	mode[Rn:Q]	Mode + 8×Rn. "Mode" and "n" are contained within the Index Byte.
10011	(Reserved for Future Use)

MOVES

Format	Instruction		Description
4	MOVi	gen,gen	Move a value.
2	MOVQi	short,gen	Extend and move a 4-bit constant.
7	MOVMi	gen,gen,disp	Move Multiple: disp bytes.
7	MOVZBW	gen,gen	Move with zero extension.
7	MOVZiD	gen,gen	Move with zero extension.
7	MOVXBW	gen,gen	Move with sign extension.
7	MOVXiD	gen,gen	Move with sign extension.
4	ADDR	gen,gen	Move Effective Address.

INTEGER ARITHMETIC

Format	Instruction		Description
4	ADDi	gen,gen	Add.
2	ADDQi	short,gen	Add 4-bit constant.
4	ADDCi	gen,gen	Add with carry.
4	SUBi	gen,gen	Subtract.
4	SUBCi	gen,gen	Subtract with carry (borrow).
6	NEGi	gen,gen	Negate (2's complement).
6	ABSi	gen,gen	Take absolute value.
7	MULi	gen,gen	Multiply.
7	QUOi	gen,gen	Divide, rounding toward zero.
7	REMi	gen,gen	Remainder from QUO.
7	DIVi	gen,gen	Divide, rounding down.
7	MODi	gen,gen	Remainder from DIV (Modulus).
7	MEIi	gen,gen	Multiply to Extended Integer.
7	DEIi	gen,gen	Divide Extended Integer.

PACKED DECIMAL (BCD)

Format	Instruction		Description
6	ADDPi	gen,gen	Add Packed.
6	SUBPi	gen,gen	Subtract Packed.

INTEGER COMPARISON

Format	Instruction		Description
4	CMPi	gen,gen	Compare.
2	CMPQi	short,gen	Compare to 4-bit constant.
7	CMPMi	gen,gen,disp	Compare Multiple: disp bytes.

LOGICAL AND BOOLEAN

Format	Instruction		Description
4	ANDi	gen,gen	Logical AND.
4	ORi	gen,gen	Logical OR.
4	BICi	gen,gen	Clear selected bits.
4	XORi	gen,gen	Logical Exclusive OR.
6	COMi	gen,gen	Complement all bits.
6	NOTi	gen,gen	Boolean complement: LSB only.
2	Scondi	gen	Save condition code (cond) as a Boolean variable of size i.

SHIFTS

Format	Instruction		Description
6	LSHi	gen,gen	Logical Shift, left or right.
6	ASHi	gen,gen	Arithmetic Shift, left or right.
6	ROTi	gen,gen	Rotate, left or right.

© IC MASTER 1983

National Semiconductor

NS16032-6

BITS

Format	Instruction		Description
4	TBITi	gen,gen	Test bit.
6	SBITi	gen,gen	Test and set bit.
6	SBITIi	gen,gen	Test and set bit, interlocked.
6	CBITi	gen,gen	Test and clear bit.
6	CBITIi	gen,gen	Test and clear bit, interlocked.
6	IBITi	gen,gen	Test and invert bit.
8	FFSi	gen,gen	Find first set bit.

BIT FIELDS

Bit fields are values in memory which are not aligned to byte boundaries. Examples are PACKED arrays and records used in Pascal. "Extract" instructions read and align a bit field. "Insert" instructions write a bit field from an aligned source.

Format	Instruction		Description
8	EXTi	reg,gen,gen,disp	Extract bit field(array oriented).
8	INSi	reg,gen,gen,disp	Insert bit field (array oriented).
7	EXTSi	gen,gen,imm,imm	Extract bit field (short form).
7	INSSi	gen,gen,imm,imm	Insert bit field (short form).
8	CVTP	reg,gen,gen	Convert to Bit Field Pointer.

ARRAYS

Format	Instruction		Description
8	CHECKi	reg,gen,gen	Index bounds check.
8	INDEXi	reg,gen,gen	Recursive indexing step for multiple-dimensional arrays.

STRINGS

String instructions assign specific functions to the General Purpose Registers:

R4 – Comparison Value
R3 – Translation Table Pointer
R2 – String 2 Pointer
R1 – String 1 Pointer
R0 – Limit Count

Options on all string instructions are:

B (Backward): Decrement string pointers after each step rather than incrementing.
U (Until match): End instruction if String 1 entry matches R4.
W (While match): End instruction if String 1 entry does not match R4.

All string instructions end when R0 decrements to zero.

Format	Instruction		Description
5	MOVSi	options	Move String 1 to String 2.
	MOVST	options	Move string, translating bytes.
5	CMPSi	options	Compare String 1 to String 2.
	CMPST	options	Compare, translating String 1 bytes.
5	SKPSi	options	Skip over String 1 entries.
	SKPST	options	Skip, translating bytes for Until/While.

© IC MASTER 1983

JUMPS AND LINKAGE

Format	Instruction		Description
3	JUMP	gen	Jump.
0	BR	disp	Branch (PC Relative).
0	Bcond	disp	Conditional branch.
3	CASEi	gen	Multiway branch.
2	ACBi	short,gen,disp	Add 4-bit constant and branch if non-zero.
3	JSR	gen	Jump to subroutine.
1	BSR	disp	Branch to subroutine.
1	CXP	disp	Call external procedure.
3	CXPD	gen	Call external procedure using descriptor.
1	SVC		Supervisor Call.
1	FLAG		Flag Trap.
1	BPT		Breakpoint Trap.
1	ENTER	[reg list],disp	Save registers and allocate stack frame (Enter Procedure).
1	EXIT	[reg list]	Restore registers and reclaim stack frame (Exit Procedure).
1	RET	disp	Return from subroutine.
1	RXP	disp	Return from external procedure call.
1	RETT	disp	Return from trap. (Privileged)
1	RETI		Return from interrupt. (Privileged)

CPU REGISTER MANIPULATION

Format	Instruction		Description
1	SAVE	[reg list]	Save General Purpose Registers.
1	RESTORE	[reg list]	Restore General Purpose Registers.
2	LPRi	areg,gen	Load Dedicated Register. (Privileged if PSR or INTBASE)
2	SPRi	areg,gen	Store Dedicated Register. (Privileged if PSR or INTBASE)
3	ADJSPi	gen	Adjust Stack Pointer.
3	BISPSRi	gen	Set selected bits in PSR. (Privileged if not Byte length)
3	BICPSRi	gen	Clear selected bits in PSR. (Privileged if not Byte length)
5	SETCFG	[option list]	Set Configuration Register. (Privileged)

FLOATING POINT

Format	Instruction		Description
11	MOVf	gen,gen	Move a Floating Point value.
9	MOVLF	gen,gen	Move and shorten a Long value to Standard.
9	MOVFL	gen,gen	Move and lengthen a Standard value to Long.
9	MOVif	gen,gen	Convert any integer to Standard or Long Floating.
9	ROUNDfi	gen,gen	Convert to integer by rounding.
9	TRUNCfi	gen,gen	Convert to integer by truncating, toward zero.
9	FLOORfi	gen,gen	Convert to largest integer less than or equal to value.
11	ADDf	gen,gen	Add.
11	SUBf	gen,gen	Subtract.
11	MULf	gen,gen	Multiply.
11	DIVf	gen,gen	Divide.
11	CMPf	gen,gen	Compare.
11	NEGf	gen,gen	Negate.
11	ABSf	gen,gen	Take absolute value.
9	LFSR	gen	Load FSR.
9	SFSR	gen	Store FSR.

MEMORY MANAGEMENT

Format	Instruction		Description
14	LMR	mreg,gen	Load Memory Management Register. (Privileged)
14	SMR	mreg,gen	Store Memory Management Register. (Privileged)
14	RDVAL	gen	Validate address for reading. (Privileged)
14	WRVAL	gen	Validate address for writing. (Privileged)
8	MOVSUi	gen,gen	Move a value from Supervisor Space to User Space. (Privileged)
8	MOVUSi	gen,gen	Move a value from User Space to Supervisor Space. (Privileged)

3 Functional Description

3.1 POWER AND GROUNDING

The NS16032 requires a single 5-volt power supply, applied on pin 48 (V_{CC}). See DC Specification Section.

Grounding connections are made on two pins. Logic Ground (GNDL, pin 24) is the common pin for on-chip logic, and Buffer Ground (GNDB, pin 25) is the common pin for the output drivers. For optimal noise immunity, it is recommended that GNDL be attached through a single conductor directly to GNDB, and that all other grounding connections be made only to GNDB, as shown below (Figure 3-1).

In addition to V_{CC} and Ground, the NS16032 CPU uses an internally-generated negative voltage. It is necessary to filter this voltage externally by attaching a pair of capacitors (Fig. 3-1) from the BBG pin to ground. Recommended values for these are:

C_1: 1 μF, Tantalum.

C_2: 1000 pF, low inductance. This should be either a disc or monolithic ceramic capacitor.

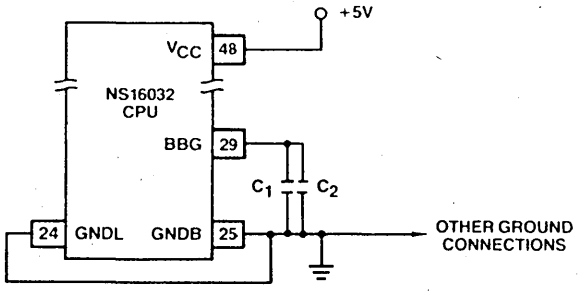

FIGURE 3-1. Recommended Supply Connections.

3.2 CLOCKING

The NS16032 inputs clocking signals from the NS16201 Timing Control Unit (TCU), which presents two non-overlapping phases of a single clock frequency. These phases are called PHI1 (pin 26) and PHI2 (pin 27). Their relationship to each other is shown below (Figure 3-2).

Each positive edge of PHI1 defines a transition in the timing state ("T-State") of the CPU. One T-State represents the execution of one microinstruction within the CPU, and/or one step of an external bus transfer. See the AC Specifications (Sec. 4) for complete specifications of PHI1 and PHI2.

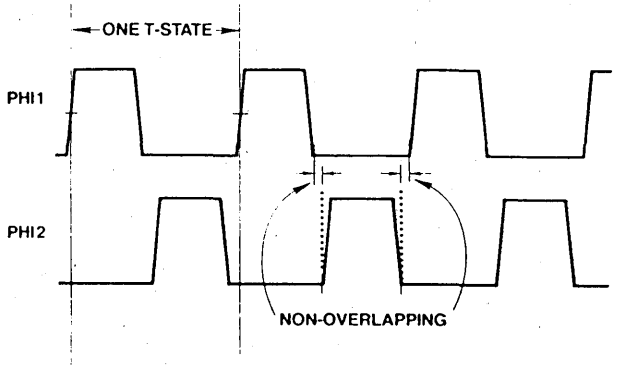

FIGURE 3-2. Clock Timing Relationships.

As the TCU presents signals with very fast transitions, it is recommended that the conductors carrying PHI1 and PHI2 be kept as short as possible, and that they not be connected anywhere except from the TCU to the CPU and, if present, the MMU. A TTL Clock signal (CTTL) is provided by the TCU for all other clocking.

3.3 RESETTING

The $\overline{RST}/\overline{ABT}$ pin serves both as a Reset for on-chip logic and as the Abort input for Memory-Managed systems. For its use as the Abort Command, see Sec. 3.5.4.

The CPU may be reset at any time by pulling the $\overline{RST}/\overline{ABT}$ pin low for at least 64 clock cycles. Upon detecting a reset, the CPU terminates instruction processing, resets its internal logic, and clears the Program Counter (PC) and Processor Status Register (PSR) to all zeroes.

On application of power, $\overline{RST}/\overline{ABT}$ must be held low for at least 50 μsec after V_{CC} is stable. This is to ensure that all on-chip voltages are completely stable before operation. Whenever a Reset is applied, it must also remain

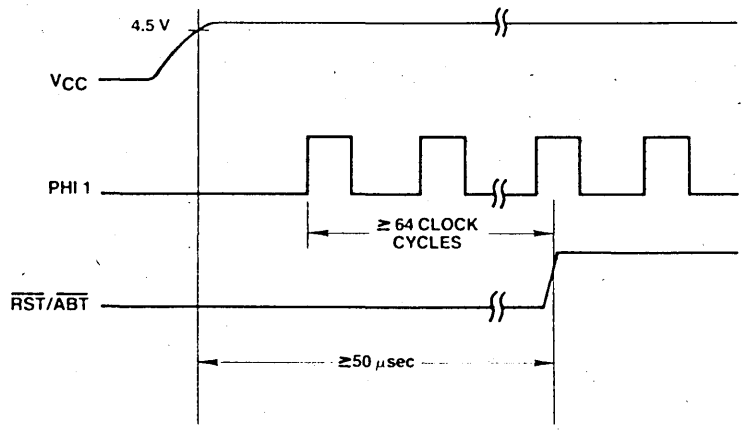

FIGURE 3-3. Power-on Reset Requirements.

© IC MASTER 1983

active for not less than 64 clock cycles. The trailing (positive-going) edge must occur while PHI1 is high, and no later than 10 ns before the PHI1 trailing edge. See Figures 3-3 and 3-4.

The NS16201 Timing Control Unit (TCU) provides circuitry to meet the Reset requirements of the NS16032 CPU. Figure 3-5a shows the recommended connections for a non-Memory-Managed system. Figure 3-5b shows the connections for a Memory-Managed system.

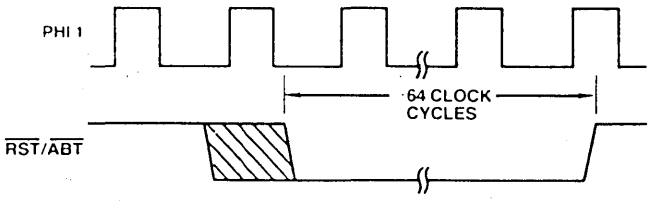

FIGURE 3-4. General Reset Timing.

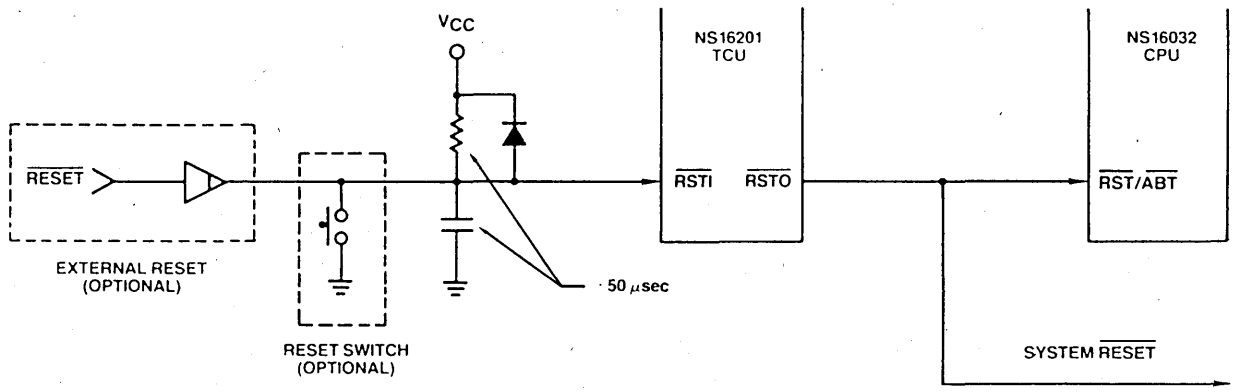

FIGURE 3-5a. Recommended Reset Connections, Non-Memory-Managed System.

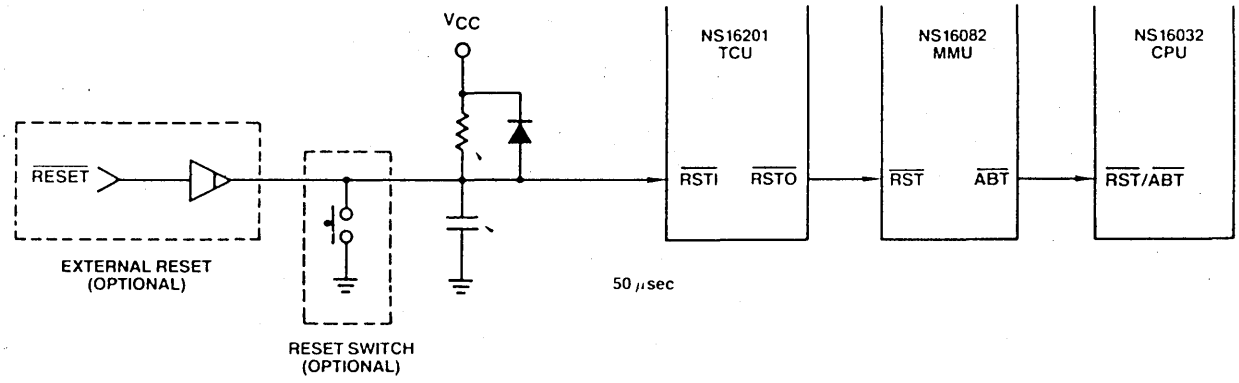

FIGURE 3-5b. Recommended Reset Connections, Memory-Managed System.

3.4 BUS CYCLES

The NS16032 CPU has a strap option which defines the Bus Timing Mode as either With or Without Address Translation. This section describes only bus cycles under the No Address Translation option. For details of the use of the strap and of bus cycles with address translation, see Sec. 3.5.

The CPU will perform a bus cycle for one of the following reasons:

1) To write or read data, to or from memory or a peripheral interface device. Peripheral input and output are memory-mapped in the NS16000 family.
2) To fetch instructions into the eight-byte instruction queue. This happens whenever the bus would otherwise be idle and the queue is not already full.
3) To acknowledge an interrupt and allow external circuitry to provide a vector number, or to acknowledge completion of an interrupt service routine.
4) To transfer information to or from a Slave Processor.

In terms of bus timing, cases 1 through 3 above are identical. For timing specifications, see Sec. 4. The only external difference between them is the four-bit code placed on the Bus Status pins (ST0-ST3). Slave Processor cycles differ in that separate control signals are applied (Sec. 3.4.6).

The sequence of events in a non-Slave bus cycle is shown below in Figure 3-7 for a Read cycle and Figure 3-8 for a Write cycle. The cases shown assume that the selected memory or interface device is capable of communicating with the CPU at full speed. If it is not, then cycle extension may be requested through the RDY line (Sec. 3.4.1).

© IC MASTER 1983

A full-speed bus cycle is performed in four cycles of the PHI1 clock signal, labeled T1 through T4. Clock cycles not associated with a bus cycle are designated Ti (for "Idle").

During T1, the CPU applies an address on pins AD0-AD15 and A16-A23. It also provides a low-going pulse on the $\overline{ADS}$ pin, which serves the dual purpose of informing external circuitry that a bus cycle is starting and of providing control to an external latch for demultiplexing Address bits 0-15 from the AD0-AD15 pins. See Figure 3-6. During this time also the status signals $\overline{DDIN}$, indicating the direction of the transfer, and $\overline{HBE}$, indicating whether the high byte (AD8-AD15) is to be referenced, become valid.

During T2 the CPU switches the Data Bus, AD0-AD15, to either accept or present data. Note that the signals A16-A23 remain valid, and need not be latched. It also starts the data strobe ($\overline{DS}$), signalling the beginning of the data transfer. Associated signals from the NS16201 Timing Control Unit are also activated at this time: $\overline{RD}$ (Read Strobe) or $\overline{WR}$ (Write Strobe), $\overline{TSO}$ (Timing State Output, indicating that T2 has been reached) and $\overline{DBE}$ (Data Buffer Enable).

The T3 state provides for access time requirements, and it occurs at least once in a bus cycle. At the beginning of T3, on the rising edge of the PHI1 clock, the RDY (Ready) line is sampled to determine whether the bus cycle will be extended (Sec. 3.4.1).

If the CPU is performing a Read cycle, the Data Bus (AD0-AD15) is sampled at the falling edge of PHI2 of the last T3 state. See Timing Specification, Sec. 4. Data must, however, be held at least until the beginning of T4. $\overline{DS}$ and $\overline{RD}$ are guaranteed not to go inactive before this point, so the rising edge of either of them may safely be used to disable the device providing the input data.

The T4 state finishes the bus cycle. At the beginning of T4, the $\overline{DS}$, $\overline{RD}$ or $\overline{WR}$, and $\overline{TSO}$ signals go inactive, and at the rising edge of PHI2, $\overline{DBE}$ goes inactive, having provided for necessary data hold times. Addresses (and Data during Write cycles) remain valid from the CPU throughout T4. Note that the Bus Status lines (ST0-ST3) change at the beginning of T4, anticipating the following bus cycle (if any).

3.4.1 Cycle Extension

To allow sufficient strobe widths and access times for any speed of memory or peripheral device, the NS16032 provides for extension of a bus cycle. Any type of bus cycle except a Slave Processor cycle can be extended.

In Figures 3-7 and 3-8, note that during T3 all bus control signals from the CPU and TCU are flat. Therefore, a bus cycle can be cleanly extended by causing the T3 state to be repeated. This is the purpose of the RDY (Ready) pin.

At the beginning of T3, on the rising edge of PHI1, the RDY line is sampled by the CPU. If RDY is high, the next T-State will be T4, ending the bus cycle. If it is sampled low, then the next T-State will be another T3, and the RDY line will again be sampled on PHI1. Each additional T3 state after the first is referred to as a "WAIT State". See Figure 3-9.

The RDY pin is driven by the NS16201 Timing Control Unit, which applies WAIT States to the CPU as requested on three sets of pins:

1) $\overline{\text{CWAIT}}$ (Continuous WAIT), which holds the CPU in WAIT states until removed.
2) $\overline{\text{WAIT1}}$, $\overline{\text{WAIT2}}$, $\overline{\text{WAIT4}}$, $\overline{\text{WAIT8}}$ (Collectively $\overline{\text{WAITn}}$), which may be given a four-bit binary value requesting a specific number of WAIT States from 0 to 15.
3) $\overline{\text{PER}}$ (Peripheral), which inserts five additional WAIT states and causes the TCU to reshape the $\overline{\text{RD}}$ and $\overline{\text{WR}}$ strobes. This provides the setup and hold times required by most MOS peripheral interface devices.

Combinations of these various WAIT requests are both legal and useful. For details on their use, see the NS16201 Data Sheet.

Figure 3-10 illustrates a typical Read cycle, with two WAIT states requested through the TCU $\overline{\text{WAITn}}$ pins.

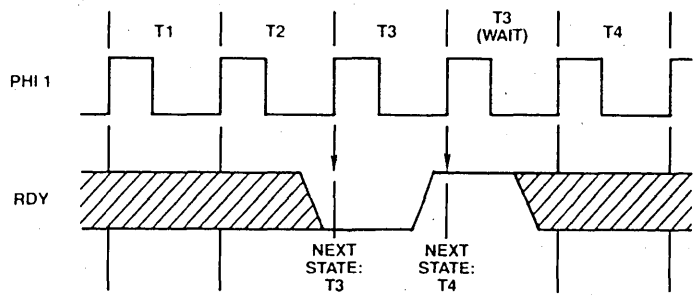

FIGURE 3-9. RDY Pin Timing.

3.4.2 Bus Status

The NS16032 CPU presents four bits of Bus Status information on pins ST0-ST3. The various combinations on these pins indicate why the CPU is performing a bus cycle, or, if it is idle on the bus, then why it is idle.

Referring to Figures 3-7 and 3-8, note that Bus Status leads the corresponding Bus Cycle, going valid one clock cycle before T1, and changing to the next state at T4. This allows the system designer to fully decode the Bus Status and, if desired, latch the decoded signals before $\overline{\text{ADS}}$ initiates the Bus Cycle.

The Bus Status pins are interpreted as a four-bit value, with ST0 the least significant bit. Their values decode as follows:

0000 – The bus is idle because the CPU does not yet need access to the bus.

0001 – The bus is idle because the CPU is executing the WAIT instruction.

0010 – (Reserved for future use.)

0011 – The bus is idle because the CPU is waiting for a Slave Processor to complete an instruction.

0100 – Interrupt Acknowledge, Master.
The CPU is performing a Read cycle. To acknowledge receipt of a Non-Maskable Interrupt (on $\overline{\text{NMI}}$) it will read from address $FFFF00_{16}$, but will ignore any data provided. To acknowledge receipt of a Maskable Interrupt (on $\overline{\text{INT}}$) it will read from address $FFFE00_{16}$, expecting a vector number to be provided from the Master NS16202 Interrupt Control Unit. If the vectoring mode selected by the last SETCFG instruction was Non-Vectored, then the CPU will ignore the value it has read and will use a default vector instead, having assumed that no NS16202 is present. See Sec. 3.4.5.

0101 – Interrupt Acknowledge, Cascaded.
The CPU is reading a vector number from a Cascaded NS16202 Interrupt Control Unit. The address provided is the address of the NS16202 Hardware Vector register. See Sec. 3.4.5.

0110 – End of Interrupt, Master.
The CPU is performing a Read cycle to indicate that it is executing a Return from Interrupt (RETI) instruction. See Sec. 3.4.5.

0111 – End of Interrupt, Cascaded.
The CPU is reading from a Cascaded Interrupt Control Unit to indicate that it is returning (through RETI) from an interrupt service routine requested by that unit. See Sec. 3.4.5.

1000 – Sequential Instruction Fetch.
The CPU is reading the next sequential word from the instruction stream into the Instruction

© IC MASTER 1983

Queue. It will do so whenever the bus would otherwise be idle and the queue is not already full.

1001 – Non-Sequential Instruction Fetch.
The CPU is performing the first fetch of instruction code after the Instruction Queue is purged. This will occur as a result of any jump or branch, or any interrupt or trap, or execution of certain instructions.

1010 – Data Transfer.
The CPU is reading or writing an operand of an instruction.

1011 – Read RMW Operand.
The CPU is reading an operand which will subsequently be modified and rewritten. If memory protection circuitry would not allow the following Write cycle, it must abort this cycle.

1100 – Read for Effective Address Calculation.
The CPU is reading information from memory in order to determine the Effective Address of an operand. This will occur whenever an instruction uses the Memory Relative or External addressing mode.

1101 – Transfer Slave Processor Operand.
The CPU is either transferring an instruction operand to or from a Slave Processor, or it is issuing the Operation Word of a Slave Processor instruction. See Sec. 3.9.1.

1110 – Read Slave Processor Status.
The CPU is reading a Status Word from a Slave Processor. This occurs after the Slave Processor has signalled completion of an instruction. The transferred word tells the CPU whether a trap should be taken, and in some instructions it presents new values for the CPU Processor Status Register bits N, Z, L or F. See Sec. 3.9.1.

1111 – Broadcast Slave ID.
The CPU is initiating the execution of a Slave Processor instruction. The ID Byte (first byte of the instruction) is sent to all Slave Processors, one of which will recognize it. From this point the CPU is communicating with only one Slave Processor. See Sec. 3.9.1.

3.4.3 Data Access Sequences

The 24-bit address provided by the NS16032 is a byte address; that is, it uniquely identifies one of up to 16,777,216 eight-bit memory locations. An important feature of the NS16032 is that the presence of a 16-bit data bus imposes no restrictions on data alignment; any data item, regardless of size, may be placed starting at any memory address. The NS16032 provides a special control signal, High Byte Enable ($\overline{HBE}$), which facilitates individual byte addressing on a 16-bit bus.

Memory is intended to be organized as two eight-bit banks, each bank receiving the word address (A1-A23) in parallel. One bank, connected to Data Bus pins AD0-AD7, is enabled to respond to even byte addresses; i.e., when the least significant address bit (A0) is low. The other bank, connected to Data Bus pins AD8-AD15, is enabled when $\overline{HBE}$ is low. See Figure 3-11.

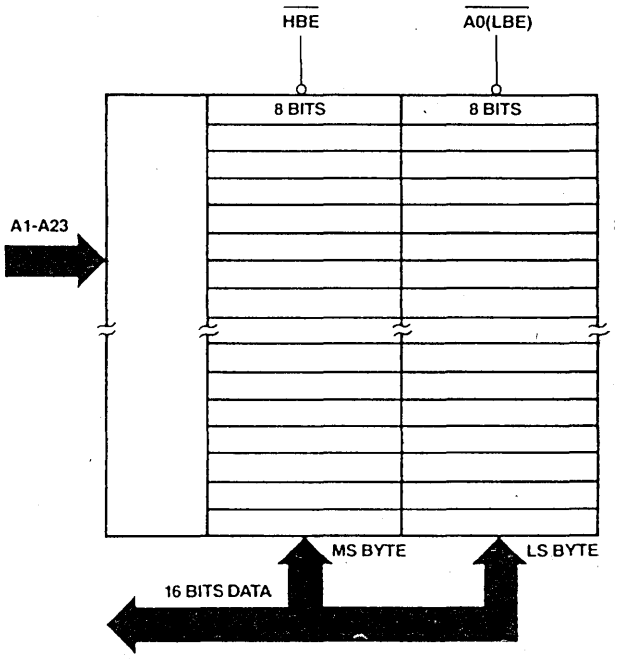

FIGURE 3-11. Memory Interface.

Any bus cycle falls into one of three categories: Even Byte Access, Odd Byte Access, and Even Word Access. All accesses to any data type are made up of sequences of these cycles. Table 3-1 gives the states of A0 and $\overline{HBE}$ for each category.

Table 3-1.
Bus Cycle Categories

Category	$\overline{HBE}$	A0
Even Byte	1	0
Odd Byte	0	1
Even Word	0	0

Accesses of operands requiring more than one bus cycle are performed sequentially, with no idle T-States separating them. The number of bus cycles required to transfer an operand depends on its size and its alignment (i.e., whether it starts on an even byte address or an odd byte address). Table 3-2 lists the bus cycle performed for each situation. For the timing of A0 and $\overline{HBE}$ see Sec. 3.4.

© IC MASTER 1983

Table 3.2
Access Sequences

Cycle	Type	Address	$\overline{HBE}$	A0	High Bus	Low Bus
		A. Odd Word Access Sequence				
					BYTE 1 | BYTE 0 ← A	
1	Odd Byte	A	0	1	Byte 0	Don't Care
2	Even Byte	A+1	1	0	Don't Care	Byte 1
		B. Even Double-Word Access Sequence				
					BYTE 3 | BYTE 2 | BYTE 1 | BYTE 0 ← A	
1	Even Word	A	0	0	Byte 1	Byte 0
2	Even Word	A+2	0	0	Byte 3	Byte 2
		C. Odd Double-Word Access Sequence				
					BYTE 3 | BYTE 2 | BYTE 1 | BYTE 0 ← A	
1	Odd Byte	A	0	1	Byte 0	Don't Care
2	Even Word	A+1	0	0	Byte 2	Byte 1
3	Even Byte	A+3	1	0	Don't Care	Byte 3
		D. Even Quad-Word Access Sequence				
					BYTE 7 | BYTE 6 | BYTE 5 | BYTE 4 | BYTE 3 | BYTE 2 | BYTE 1 | BYTE 0 ← A	
1	Even Word	A	0	0	Byte 1	Byte 0
2	Even Word	A+2	0	0	Byte 3	Byte 2
Other bus cycles (instruction prefetch or slave) can occur here.						
3	Even Word	A+4	0	0	Byte 5	Byte 4
4	Even Word	A+6	0	0	Byte 7	Byte 6
		E. Odd Quad-Word Access Sequence				
					BYTE 7 | BYTE 6 | BYTE 5 | BYTE 4 | BYTE 3 | BYTE 2 | BYTE 1 | BYTE 0 ← A	
1	Odd Byte	A	0	1	Byte 0	Don't Care
2	Even Word	A+1	0	0	Byte 2	Byte 1
3	Even Byte	A+3	1	0	Don't Care	Byte 3
Other bus cycles (instruction prefetch or slave) can occur here.						
4	Odd Byte	A+4	0	1	Byte 4	Don't Care
5	Even Word	A+5	0	0	Byte 6	Byte 5
6	Even Byte	A+7	1	0	Don't Care	Byte 7

3.4.3.1 Bit Accesses

The Bit Instructions perform byte accesses to the byte containing the designated bit. The Test and Set Bit instruction (SBIT), for example, reads a byte, alters it, and rewrites it, having changed the contents of one bit.

3.4.3.2 Bit Field Accesses

An access to a Bit Field in memory always generates a Double-Word transfer at the address containing the least significant bit of the field. The Double Word is read by an Extract instruction; an Insert instruction reads a Double Word, modifies it, and rewrites it.

3.4.3.3 Extending Multiply Accesses

The Extending Multiply instruction (MEI) will return a result which is twice the size in bytes of the operands which it reads. If the multiplicand is in memory, the most-significant half of the result is written first (at the higher address), then the least-significant half. This is done in order to support retry if this instruction is aborted.

3.4.4 Instruction Fetches

Instructions for the NS16032 CPU are "prefetched"; that is, they are input before being needed into the next available entry of the eight-byte Instruction Queue. The CPU performs two types of Instruction Fetch cycles: Sequential and Non-Sequential. These can be distinguished from each other by their differing status combinations on pins ST0-ST3 (Sec. 3.4.2).

A Sequential Fetch will be performed by the CPU whenever the Data Bus would otherwise be idle and the Instruction Queue is not currently full. Sequential Fetches are always Even Word Read cycles (Table 3-1).

A Non-Sequential Fetch occurs as a result of any break in the normally sequential flow of a program. Any jump or branch instruction, a trap or an interrupt will cause the next Instruction Fetch cycle to be Non-Sequential. In addition, certain instructions flush the instruction queue, causing the next instruction fetch to display Non-Sequential status. Only the first bus cycle after a break displays Non-Sequential status, and that cycle is either an Even Word Read or an Odd Byte Read, depending on whether the destination address is even or odd.

3.4.5 Interrupt Control Cycles

Activating the $\overline{INT}$ or $\overline{NMI}$ pin on the CPU will initiate one or more bus cycles whose purpose is interrupt control rather than the transfer of instructions or data. Execution of the Return from Interrupt instruction (RETI) will also cause Interrupt Control bus cycles. These differ from instruction or data transfers only in the status presented on pins ST0-ST3. All Interrupt Control cycles are single-byte Read cycles.

This section describes only the Interrupt Control sequences associated with each interrupt and with the return from its service routine. For full details of the NS16032 interrupt structure, see Sec. 3.8.

© IC MASTER 1983

Table 3-3
Interrupt Sequences

Cycle	Status	Address	$\overline{DDIN}$	$\overline{HBE}$	A0	High Bus	Low Bus
A. Non-Maskable Interrupt Control Sequences.							
Interrupt Acknowledge							
1	0100	$FFFF00_{16}$	0	1	0	Don't Care	Don't Care
Interrupt Return							
None: Performed through Return from Trap (RETT) instruction.							
B. Non-Vectored Interrupt Control Sequences.							
Interrupt Acknowledge							
1	0100	$FFFE00_{16}$	0	1	0	Don't Care	Don't Care
Interrupt Return							
1	0110	$FFFE00_{16}$	0	1	0	Don't Care	Don't Care
C. Vectored Interrupt Sequences: Non-Cascaded.							
Interrupt Acknowledge							
1	0100	$FFFE00_{16}$	1	1	0	Don't Care	Vector: Range: 0-127
Interrupt Return							
1	0110	$FFFE00_{16}$	0	1	0	Don't Care	Vector: Same as in Previous Int. Ack. Cycle
D. Vectored Interrupt Sequences: Cascaded.							
Interrupt Acknowledge							
1	0100	$FFFE00_{16}$	0	1	0	Don't Care	Cascade Index: range −16 to −1
(The CPU here uses the Cascade Index to find the Cascade Address.)							
2	0101	Cascade Address	0	1 or 0*	0 or 1*	Vector, range 0-255; on appropriate half of Data Bus for even/odd address	
Interrupt Return							
1	0110	$FFFE00_{16}$	0	1	0	Don't Care	Cascade Index: same as in previous Int. Ack. Cycle
(The CPU here uses the Cascade Index to find the Cascade Address.)							
2	0111	Cascade Address	0	1 or 0*	0 or 1*	Don't Care	Don't Care

*If the Cascaded ICU Address is Even (A0 is low), then the CPU applies $\overline{HBE}$ high and reads the vector number from bits 0-7 of the Data Bus. If the address is Odd (A0 is high), then the CPU applies $\overline{HBE}$ low and reads the vector number from bits 8-15 of the Data Bus. The vector number may be in the range 0-255.

3.4.6 Slave Processor Communication

In addition to its use as the Address Translation strap (Sec. 3.5.1), the $\overline{AT}/\overline{SPC}$ pin is used as the data strobe for Slave Processor transfers. In this role, it is referred to as Slave Processor Control ($\overline{SPC}$). In a Slave Processor bus cycle, data is transferred on the Data Bus (AD0-AD15), and the least significant two bits of CPU cycle status (ST0-ST1) are monitored by each Slave Processor in order to determine the type of transfer being performed. $\overline{SPC}$ is bidirectional, but is driven by the CPU during all Slave Processor bus cycles. See Sec. 3.9 for full protocol sequences.

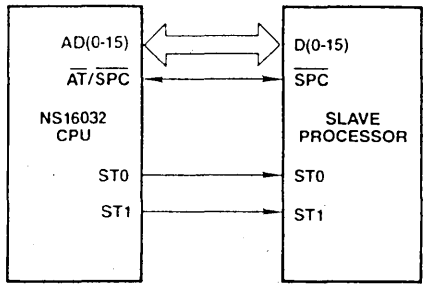

FIGURE 3-12. Slave Processor Connections.

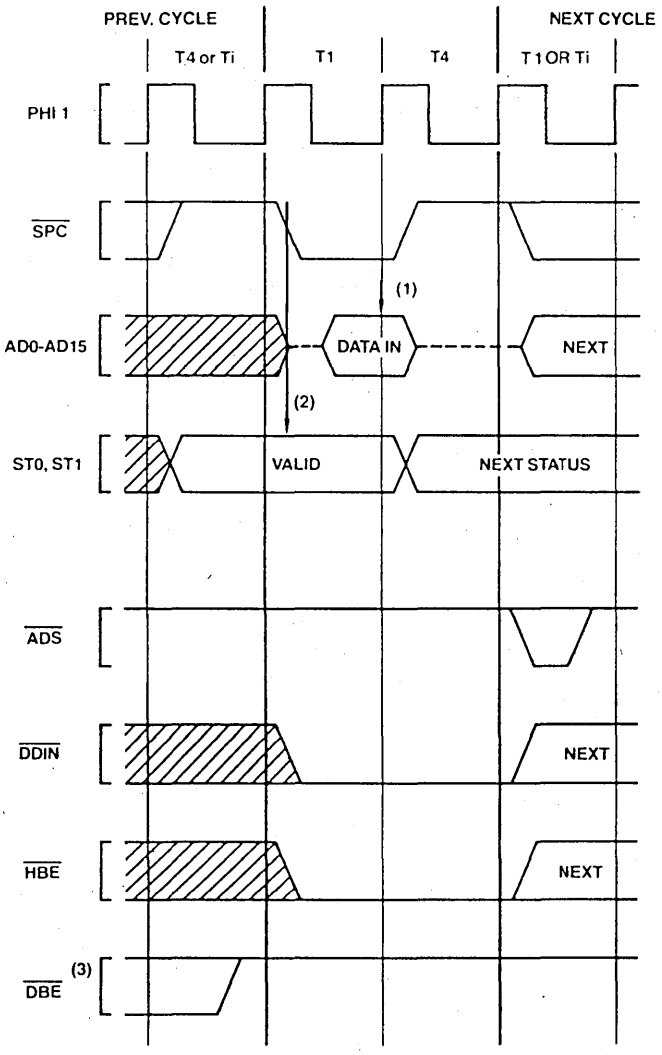


NOTE:

(1) CPU samples Data Bus here.

(2) Slave Processor samples CPU Status here.

(3) $\overline{DBE}$ and all other NS16201 TCU bus signals remain inactive because no $\overline{ADS}$ pulse is received from the CPU.

FIGURE 3-13. CPU Read from Slave Processor.

© IC MASTER 1983

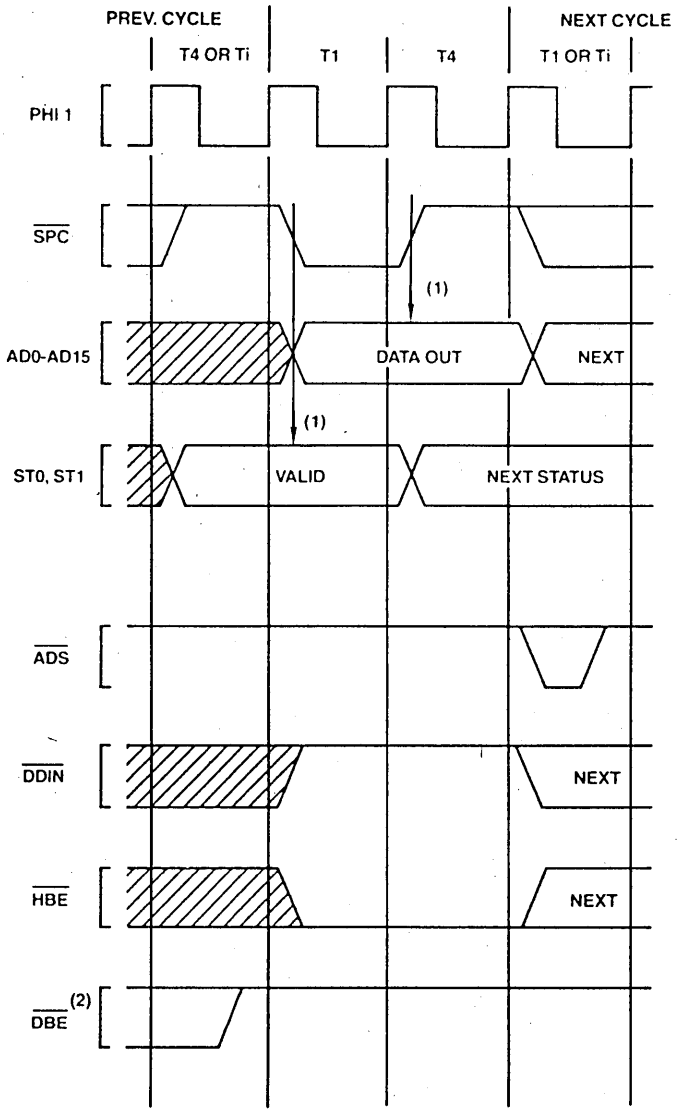
3.4.6.1 Slave Processor Bus Cycles

A Slave Processor bus cycle always takes exactly two clock cycles, labelled T1 and T4 (see Figures 3-13 and 3-14). During a Read cycle, $\overline{SPC}$ is activated at T1, data is sampled at T4, and $\overline{SPC}$ is removed. The Cycle Status pins lead the cycle by one clock period, and are sampled at the leading edge of $\overline{SPC}$. During a Write cycle, the CPU applies data and activates $\overline{SPC}$ at T1, removing $\overline{SPC}$ at T4. The Slave Processor latches status on the leading edge of $\overline{SPC}$ and latches data on the trailing edge.

Since the CPU does not pulse the Address Strobe ($\overline{ADS}$), no bus signals are generated by the NS16201 Timing Control Unit. The direction of a transfer is determined by the sequence ("protocol") established by the instruction under execution; but the CPU indicates the direction on the $\overline{DDIN}$ pin for hardware debugging purposes.

3.4.6.2 Operand Transfer Sequences

A Slave Processor operand is transferred in one or more Slave bus cycles. A Byte operand is transferred on the least-significant byte of the Data Bus (AD0-AD7), and a Word operand is transferred on the entire bus. A Double Word is transferred in a consecutive pair of bus cycles, least-significant word first. A Quad Word is transferred in two pairs of Slave cycles, with other bus cycles possibly occurring between them. The word order is from least-significant word to most-significant.



NOTE:

(1) Arrows indicate points at which the Slave Processor samples.

(2) $\overline{DBE}$, being provided by the NS16201 TCU, remains inactive due to the fact that no pulse is presented on $\overline{ADS}$. TCU signals $\overline{RD}$, $\overline{WR}$ and $\overline{TSO}$ also remain inactive.

FIGURE 3-14. CPU Write to Slave Processor.

© IC MASTER 1983

3.5 MEMORY MANAGEMENT OPTION

The NS16032 CPU, in conjunction with the NS16082 Memory Management Unit (MMU), provides full support for address translation, memory protection, and memory allocation techniques up to and including Virtual Memory.

3.5.1 Address Translation Strap

The Bus Interface Control section of the NS16032 CPU has two bus timing modes: With or Without Address Translation. The mode of operation is selected by the CPU by sampling the $\overline{AT}/\overline{SPC}$ (Address Translation/ Slave Processor Control) pin on the rising edge of the $\overline{RST}$ (Reset) pulse. If $\overline{AT}/\overline{SPC}$ is sampled as high, the bus timing is as previously described in Sec. 3.4. If it is sampled as low, two changes occur:

1) An extra clock cycle, Tmmu, is inserted into all bus cycles except Slave Processor transfers.
2) The $\overline{DS}/\overline{FLT}$ pin changes in function from a Data Strobe output ($\overline{DS}$) to a Float Command input ($\overline{FLT}$).

The NS16082 MMU will itself pull the CPU $\overline{AT}/\overline{SPC}$ pin low when it is reset, but this pin may be left floating in non-Memory-Managed systems.

Note that the Address Translation strap does not specifically declare the presence of an NS16082 MMU, but

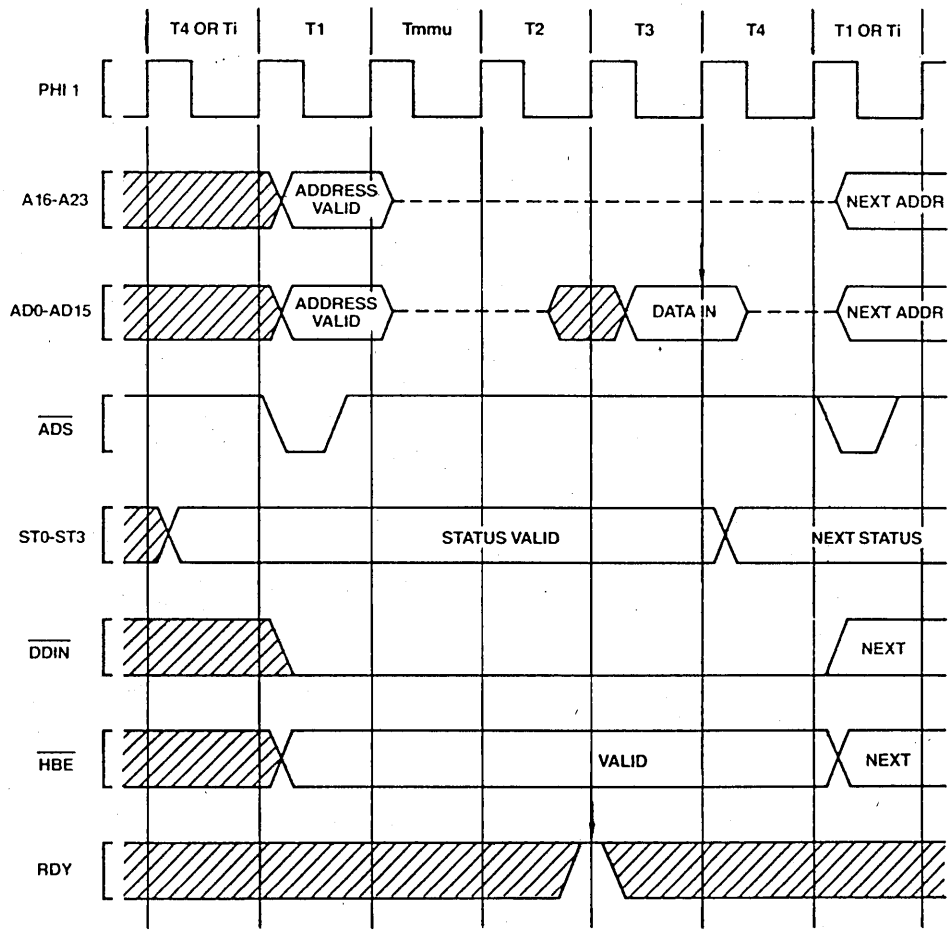


FIGURE 3-15. Read Cycle with Address Translation (CPU Action).

© IC MASTER 1983

only the presence of external address translation circuitry. MMU instructions will still trap as being undefined unless the SETCFG (Set Configuration) instruction is executed to declare the MMU instruction set valid. See Sec. 2.1.3.

3.5.2 Translated Bus Timing

Figures 3-15 and 3-16 illustrate the CPU activity during a Read cycle and a Write cycle in Address Translation mode. The additional T-State, Tmmu, is inserted between T1 and T2. During this time the CPU places AD0-AD15 and A16-A23 into the TRI-STATE® mode, allowing the MMU to assert the translated address and issue the physical address strobe $\overline{PAV}$. T2 through T4 of the cycle are identical to their counterparts without Address Translation, with the exception that the CPU Address lines A16-A23 remain in the TRI-STATE condition. This allows the MMU to continue asserting the translated address on those pins.

Figures 3-17 and 3-18 show a Read cycle and a Write cycle as generated by the 16032/16082/16201 group. Note that with the CPU $\overline{ADS}$ signal going only to the MMU, and with the MMU $\overline{PAV}$ signal substituting for $\overline{ADS}$ everywhere else, Tmmu through T4 look exactly like T1 through T4 in a non-Memory-Managed system. For the connection diagram, see Appendix B.

3.5.3 The $\overline{FLT}$ (Float) Pin

In Address Translation mode, the $\overline{DS}/\overline{FLT}$ pin is treated as the input command $\overline{FLT}$ (Float). Activating $\overline{FLT}$ during Tmmu causes the CPU to wait longer than Tmmu for address translation and validation. This feature is used occasionally by the NS16082 MMU in order to update its internal translation cache from page tables in memory, or to update certain status bits within them.

Figure 3-19 shows the effects of $\overline{FLT}$. Upon sampling $\overline{FLT}$ low, late in Tmmu, the CPU enters idle T-States (Tf) during which it:

1) Sets AD0-AD15, A16-A23, $\overline{ADS}$ and $\overline{DDIN}$ to the TRI-STATE condition ("floating").
2) Sets $\overline{HBE}$ low.
3) Suspends further internal processing of the current instruction. This ensures that the current instruction remains abortable with retry. (See $\overline{RST}/\overline{ABT}$ description, Sec. 3.5.4.)

Note that the AD0-AD15 pins may be briefly asserted during the first idle T-State. The above conditions remain in effect until $\overline{FLT}$ again goes high. See the Timing Specifications, Sec. 4.

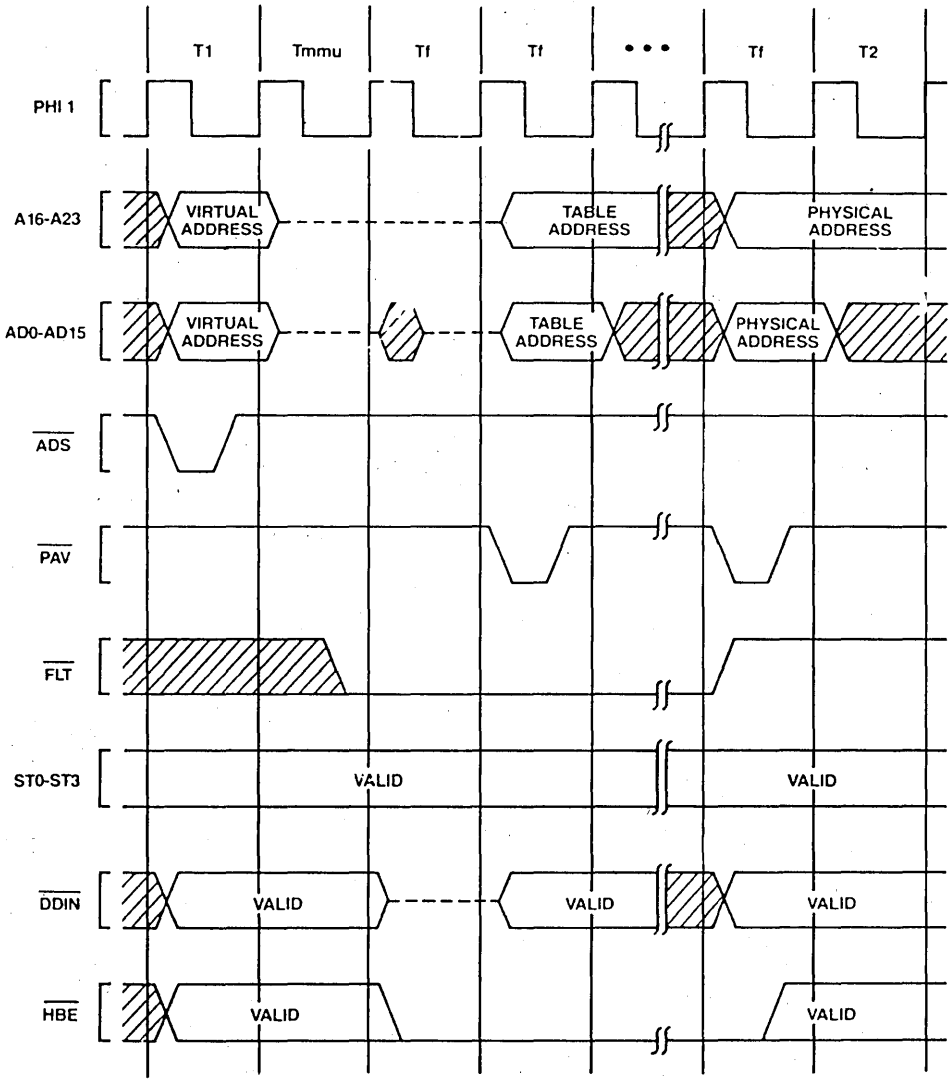

FIGURE 3-19. $\overline{FLT}$ Float Command Timing.

© IC MASTER 1983

3.5.4 Aborting Bus Cycles

The $\overline{RST}/\overline{ABT}$ pin, apart from its Reset function (Sec. 3.3), also serves as the means to "abort", or cancel, a bus cycle and the instruction, if any, which initiated it. An Abort request is distinguished from a Reset in that the $\overline{RST}/\overline{ABT}$ pin is held active for only one clock cycle.

If $\overline{RST}/\overline{ABT}$ is pulled low during Tmmu or Tf, this signals that the cycle must be aborted. The CPU itself will enter T2 and then Ti, thereby terminating the cycle. Since it is the MMU $\overline{PAV}$ signal which triggers a physical cycle, the rest of the system remains unaware that a cycle was even started.

The NS16082 MMU will abort a bus cycle for either of two reasons:

1) The CPU is attempting to access a virtual address which is not currently resident in physical memory. The referenced page must be brought into physical memory from mass storage to make it accessible to the CPU.

2) The CPU is attempting to perform an access which is not allowed due to the protection level assigned to that page.

When a bus cycle is aborted by the MMU, the instruction which caused it to occur is also aborted in such a manner that it is guaranteed re-executable later. Due to the NS16000 Family instruction set definition and its implementation in the NS16032 CPU, the only information which is changed irrecoverably by such partly-executed instructions is information which does not affect their re-execution.

3.5.4.1 The Abort Interrupt

Upon aborting an instruction, the CPU immediately performs an interrupt through the ABT vector in the Interrupt Table (see Sec. 3.8). The Return Address pushed on the Interrupt Stack is the address of the aborted instruction, such that a Return from Trap (RETT) instruction will automatically retry it.

The one exception to this sequence occurs if the aborted bus cycle was an instruction prefetch. If so, it is not yet certain that the aborted prefetched code is to be executed. Insted of causing an interrupt, the CPU only aborts the bus cycle, and stops prefetching. If the information in the Instruction Queue runs out, meaning that the instruction will actually be executed, the ABT interrupt will occur, in effect aborting the instruction which was being fetched.

3.5.4.2 Hardware Considerations

In order to guarantee instruction retry, certain rules must be followed in applying an Abort to the CPU. These rules are followed by the NS16082 Memory Management Unit.

1) If $\overline{FLT}$ has not been applied to the CPU, the Abort pulse must occur during or before Tmmu. See the Timing Specifications, Figure 4-22.

2) If $\overline{FLT}$ has been applied to the CPU, the Abort pulse must be applied before the T-State in which $\overline{FLT}$ goes inactive. The CPU will not actually respond to the Abort command until $\overline{FLT}$ is removed. See Figure 4-23.

3) No bus cycle may be aborted which is the Write half of a Read-Modify-Write operand access. The CPU guarantees that this will never be necessary for Memory Management functions by applying a special RMW status (Status Code 1011) during the Read half of the access. When the CPU presents RMW status, that cycle must be aborted if it would be illegal to write to any of the accessed addresses.

If $\overline{RST}/\overline{ABT}$ is pulsed at any time other than as indicated above, it will abort the instruction currently under execution, and will act as a very high-priority interrupt. However, the program which was running at the time is not guaranteed recoverable, and should be terminated.

3.6 BUS ACCESS CONTROL

The NS16032 CPU has the capability of relinquishing its access to the bus upon request from a DMA device or another CPU. This capability is implemented on the $\overline{HOLD}$ (Hold Request) and $\overline{HLDA}$ (Hold Acknowledge) pins. By asserting $\overline{HOLD}$ low, an external device requests access to the bus. On receipt of $\overline{HLDA}$ from the CPU, the device may perform bus cycles, as the CPU at this point has set the AD0-AD15, A16-A23, $\overline{ADS}$, $\overline{DDIN}$ and $\overline{HBE}$ pins to the TRI-STATE® condition. To return control of the bus to the CPU, the device sets $\overline{HOLD}$ inactive, and the CPU acknowledges return of the bus by setting $\overline{HLDA}$ inactive.

How quickly the CPU releases the bus depends on whether it is idle on the bus at the time the $\overline{HOLD}$ request is made, as the CPU must always complete the current bus cycle. Figure 3-20 shows the timing sequence when the CPU is idle. In this case, the CPU grants the bus during the immediately following clock cycle. Figure 3-21 shows the sequence if the CPU is using the bus at the time that the $\overline{HOLD}$ request is made. If the request is made during or before the clock cycle shown (two clock cycles before T4), the CPU will release the bus during the clock cycle following T4. If the request occurs closer to T4, the CPU may already have decided to initiate another bus cycle. In that case it will not grant the bus until after the next T4 state. Note that this situation will also occur if the CPU is idle on the bus but has initiated a bus cycle internally.

In a Memory-Managed system, the $\overline{HLDA}$ signal is connected in a daisy-chain through the NS16082, such that the MMU can release the bus if it is using it.

3.7 INSTRUCTION STATUS

In addition to the four bits of Bus Cycle status (ST0-ST3), the NS16032 CPU also presents Instruction Status information on three separate pins. These pins differ from ST0-ST3 in that they are synchronous to the CPU's internal instruction execution section rather than to its bus interface section.

$\overline{PFS}$ (Program Flow Status) is pulsed low as each instruction begins execution. It is intended for debugging purposes, and is used that way by the NS16082 Memory Management Unit.

U/$\overline{S}$ originates from the U bit of the Processor Status Register, and indicates whether the CPU is currently running in User or Supervisor mode. It is sampled by the MMU for mapping, protection and debugging purposes. Although it is not synchronous to bus cycles, there are guarantees on its validity during any given bus cycle. See the Timing Specifications, Figure 4-21.

$\overline{ILO}$ (Interlocked Operation) is activated during an SBITI (Set Bit, Interlocked) or CBITI (Clear Bit, Interlocked) instruction. It is made available to external bus arbitration circuitry in order to allow these instructions to implement the semaphore primitive operations for multiprocessor communication and resource sharing. As with the U/$\overline{S}$ pin, there are guarantees on its validity during the operand accesses performed by the instructions. See the Timing Specification Section, Figure 4-19.

3.8 NS16032 INTERRUPT STRUCTURE

$\overline{INT}$, on which maskable interrupts may be requested,

$\overline{NMI}$, on which non-maskable interrupts may be requested, and

$\overline{RST}$/$\overline{ABT}$, which may be used to abort a bus cycle and any associated instruction. It generates an interrupt request if an instruction was aborted. See Sec. 3.5.4.

In addition, there is a set of internally-generated "traps" which cause interrupt service to be performed as a result either of exceptional conditions (e.g., attempted division by zero) or of specific instructions whose purpose is to cause a trap to occur (e.g., the Supervisor Call instruction).

3.8.1 General Interrupt/Trap Sequence

Upon receipt of an interrupt or trap request, the CPU goes through four major steps:

1) Adjustment of Registers.
   Depending on the source of the interrupt or trap, the CPU may restore and/or adjust the contents of the Program Counter (PC), the Processor Status Register (PSR) and the currently-selected Stack Pointer (SP). A copy of the PSR is made, and the PSR is then set to reflect Supervisor Mode and selection of the Interrupt Stack.
2) Saving Processor Status.
   The PSR copy is pushed onto the Interrupt Stack as a 16-bit quantity.
3) Vector Acquisition.
   A Vector is either obtained from the Data Bus or is supplied by default.
4) Service Call.
   The Vector is used as an index into the Interrupt Dispatch Table, whose base address is taken from the CPU Interrupt Base (INTBASE) Register. See Figure 3-22. A 32-bit External Procedure Descriptor is read from the table entry, and an External Procedure Call is performed using it. The MOD Register (16 bits) and Program Counter (32 bits) are pushed on the Interrupt Stack.

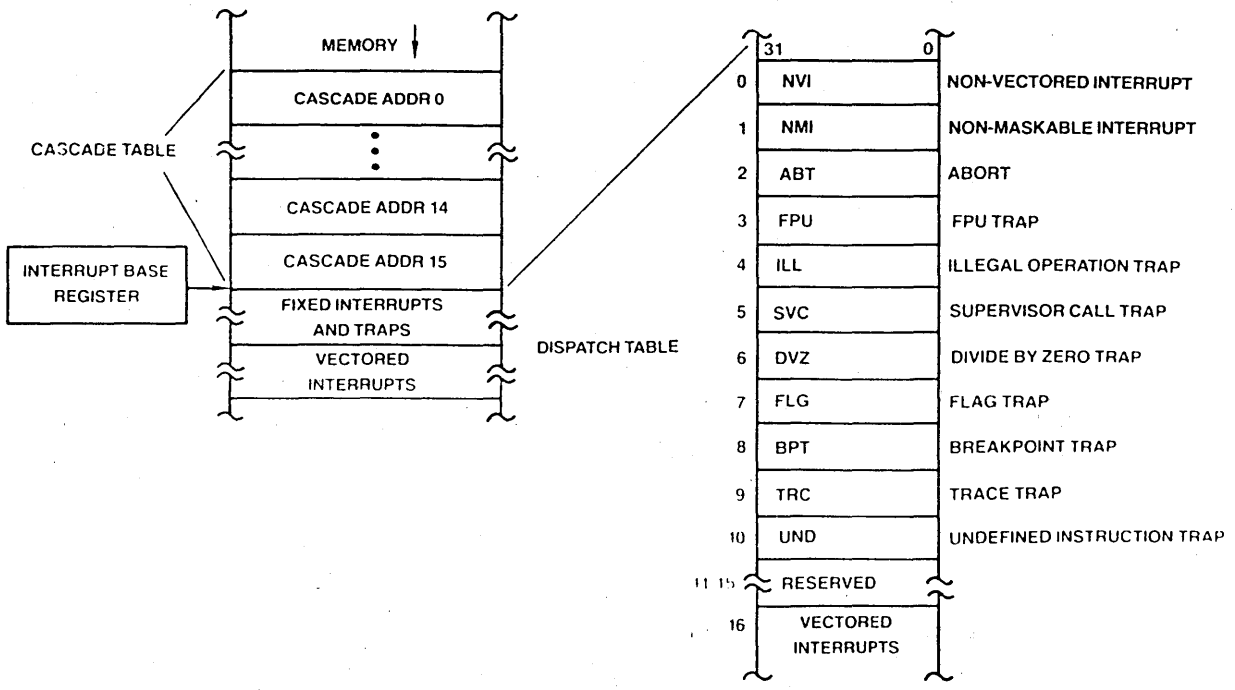

FIGURE 3-22. Interrupt Dispatch and Cascade Tables.

© IC MASTER 1983

This process is illustrated in Figure 3-23, from the viewpoint of the programmer.

Full sequences of events in processing interrupts and traps may be found as follows:

Interrupt on $\overline{INT}$ or $\overline{NMI}$ pin:	Sec. 3.8.7.1.
Abort Interrupt:	Sec. 3.8.7.4.
Traps (except Trace):	Sec. 3.8.7.2.
Trace Trap:	Sec. 3.8.7.3.

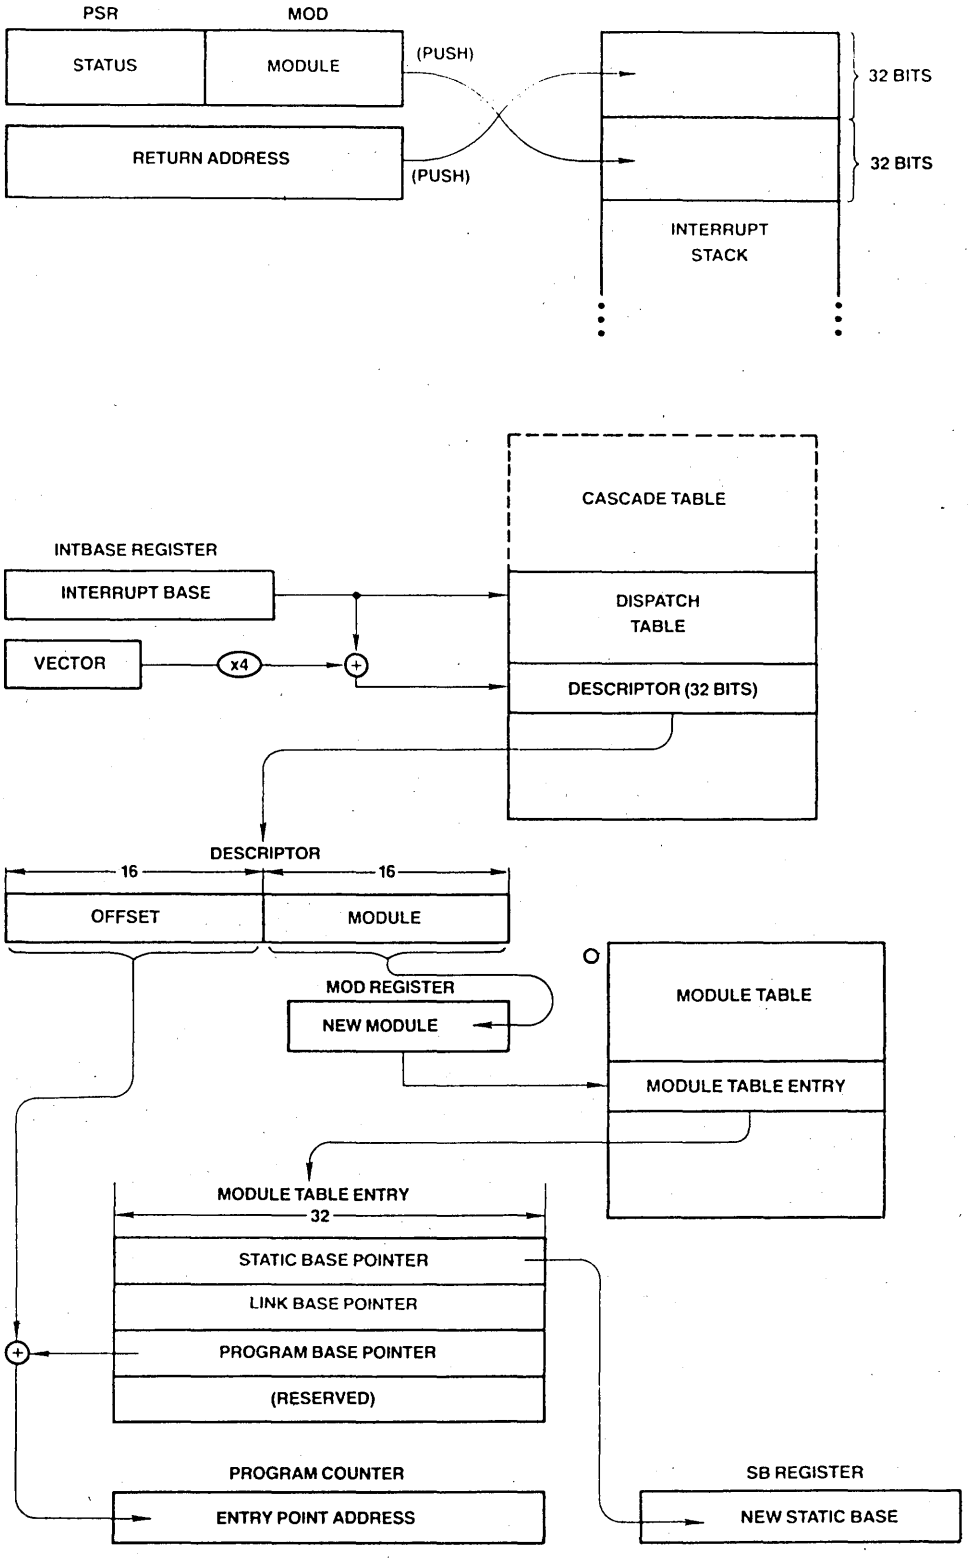

FIGURE 3-23. Interrupt/Trap Service Routine Calling Sequence.

© IC MASTER 1983

3.8.2 Interrupt/Trap Return

To return control to an interrupted program, one of two instructions is used. The RETT (Return from Trap) instruction (Figure 3-24) restores the PSR, MOD, PC and SB registers to their previous contents and, since traps are often used deliberately as a call mechanism for Supervisor Mode procedures, it also discards a specified number of bytes from the original stack as surplus parameter space. RETT is used to return from any trap or interrupt except the Maskable Interrupt. For this, the RETI (Return from Interrupt) instruction is used, which also informs any external Interrupt Control Units that interrupt service has completed. Since interrupts are generally asynchronous external events, RETI does not pop parameters. See Figure 3-25.

3.8.3 Maskable Interrupts (The $\overline{\text{INT}}$ Pin)

The $\overline{\text{INT}}$ pin is a level-sensitive input. A continuous low level is allowed for generating multiple interrupt requests. The input is maskable, and is therefore enabled to generate interrupt requests only while the Processor Status Register I bit is set. The I bit is automatically cleared during service of an $\overline{\text{INT}}$, $\overline{\text{NMI}}$ or Abort request, and is restored to its original setting upon return from the interrupt service routine via the RETT or RETI instruction.

The $\overline{\text{INT}}$ pin may be configured via the SETCFG instruction as either Non-Vectored (CFG Register bit I = 0) or Vectored (bit I = 1).

3.8.3.1 Non-Vectored Mode

In the Non-Vectored mode, an interrupt request on the $\overline{\text{INT}}$ pin will cause an Interrupt Acknowledge bus cycle, but the CPU will ignore any value read from the bus and use instead a default vector of zero. This mode is useful for small systems in which hardware interrupt prioritization is unnecessary.

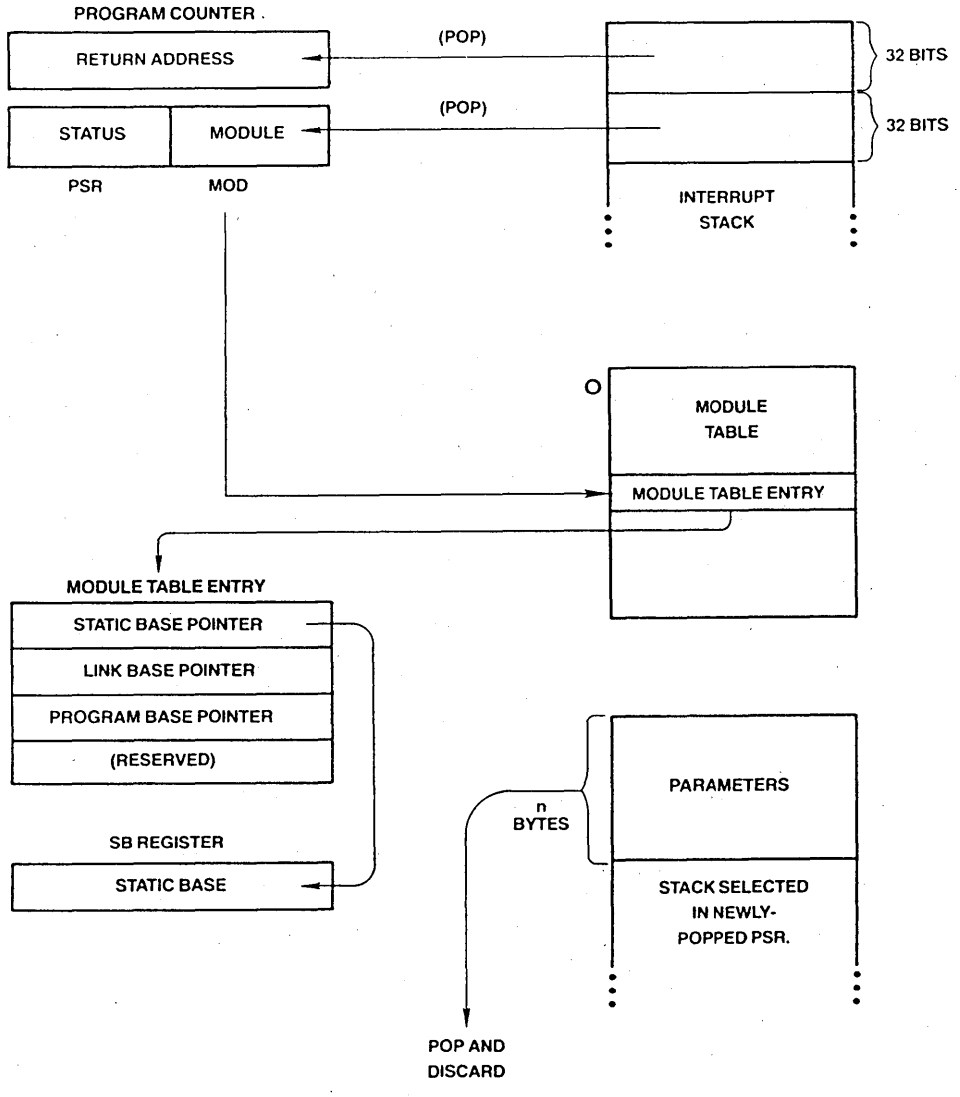

FIGURE 3-24. Return from Trap (RETT n) Instruction Flow.

© IC MASTER 1983

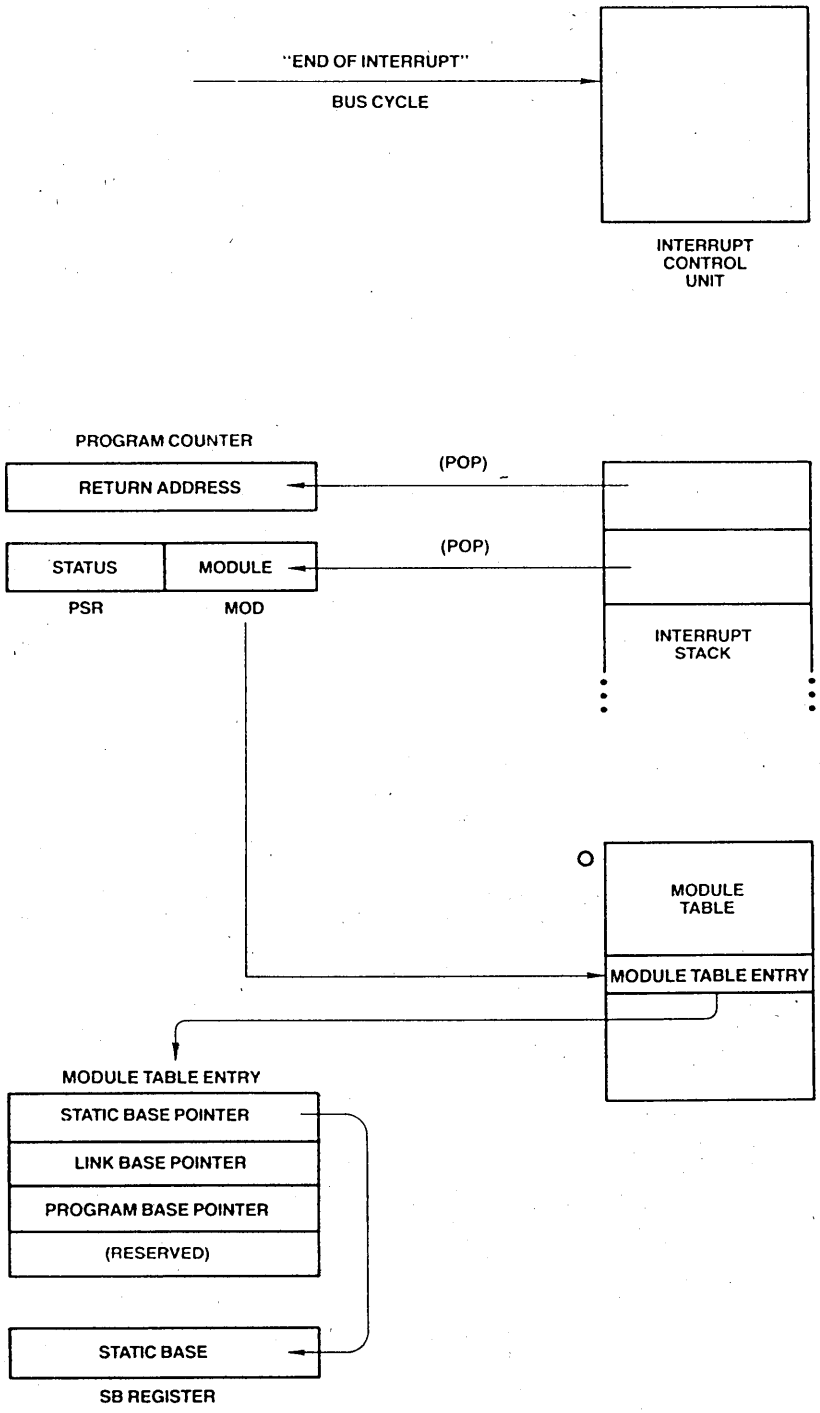

FIGURE 3-25. Return from Interrupt (RETI) Instruction Flow.

© IC MASTER 1983

3.8.3.2 Vectored Mode: Non-Cascaded Case

In the Vectored mode, the CPU uses an NS16202 Interrupt Control Unit (ICU) to prioritize up to 16 interrupt requests. Upon receipt of an interrupt request on the $\overline{INT}$ pin, the CPU performs an "Interrupt Acknowledge, Master" bus cycle (Sec. 3.4.2) reading a vector value from the low-order byte of the Data Bus. This vector is then used as an index into the Dispatch Table in order to find the External Procedure Descriptor for the proper interrupt service procedure. The service procedure eventually returns via the Return from Interrupt (RETI) instruction, which performs an End of Interrupt bus cycle, informing the ICU that it may re-prioritize any interrupt requests still pending. The ICU provides the vector number again, which the CPU uses to determine whether it needs also to inform a Cascaded ICU (see below).

In a system with only one ICU (16 levels of interrupt), the vectors provided must be in the range of 0 through 127; that is, they must be positive numbers in eight bits. By providing a negative vector number, an ICU flags the interrupt source as being a Cascaded ICU (see below).

3.8.3.3 Vectored Mode: Cascaded Case

In order to allow up to 256 levels of interrupt, provision is made both in the CPU and in the NS16202 Interrupt Control Unit (ICU) to transparently support cascading. Figure 3-27, shows a typical cascaded configuration. Note that the Interrupt output from a Cascaded ICU goes to an Interrupt Request input of the Master ICU, which is the only ICU which drives the CPU $\overline{INT}$ pin.

In a system which uses cascading, two tasks must be performed upon initialization:

1) For each Cascaded ICU in the system, the Master ICU must be informed of the line number (0 to 15) on which it receives the cascaded requests.
2) A Cascade Table must be established in memory. The Cascade Table is located in a NEGATIVE direction from the location indicated by the CPU Interrupt Base (INTBASE) Register. Its entries are 32-bit addresses, pointing to the Vector Registers of each of up to 16 Cascaded ICUs.

Figure 3-22 illustrates the position of the Cascade Table. To find the Cascade Table entry for a Cascaded ICU, take its Master ICU line number (0 to 15) and subtract 16 from it, giving an index in the range −16 to −1. Multiply this value by 4, and add the resulting negative number to the contents of the INTBASE Register The 32-bit entry at this address must be set to the address of the Hardware Vector Register of the Cascaded ICU. This is referred to as the "Cascade Address."

Upon receipt of an interrupt request from a Cascaded ICU, the Master ICU interrupts the CPU and provides the negative Cascade Table index instead of a (positive) vector number. The CPU, seeing the negative value, uses it as an index into the Cascade Table and reads the Cascade Address from the referenced entry. Applying this address, the CPU performs an "Interrupt Acknowledge, Cascaded" bus cycle (Sec. 3.4.2), reading the final vector value. This vector is interpreted by the CPU as an unsigned byte, and can therefore be in the range of 0 through 255.

In returning from a Cascaded interrupt, the service procedure executes the Return from Interrupt (RETI) instruction, as it would for any Maskable Interrupt. The CPU performs an "End of Interrupt, Master" bus cycle (Sec. 3.4.2), whereupon the Master ICU again provides the negative Cascade Table index. The CPU, seeing a negative value, uses it to find the corresponding Cascade Address from the Cascade Table. Applying this address, it performs an "End of Interrupt, Cascaded" bus cycle (Sec. 3.4.2), informing the Cascaded ICU of the completion of the service routine. The byte read from the Cascaded ICU is discarded.

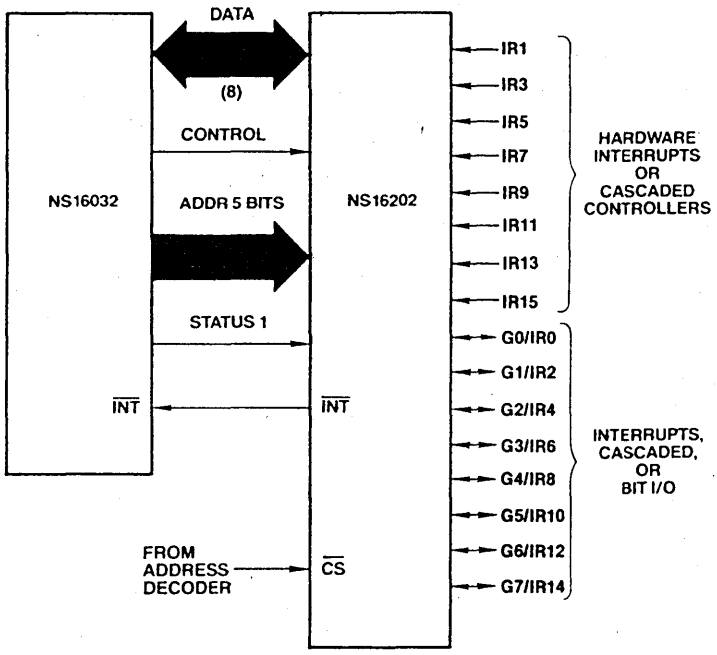

FIGURE 3-26. Interrupt Control Unit Connections (16 Levels).

© IC MASTER 1983

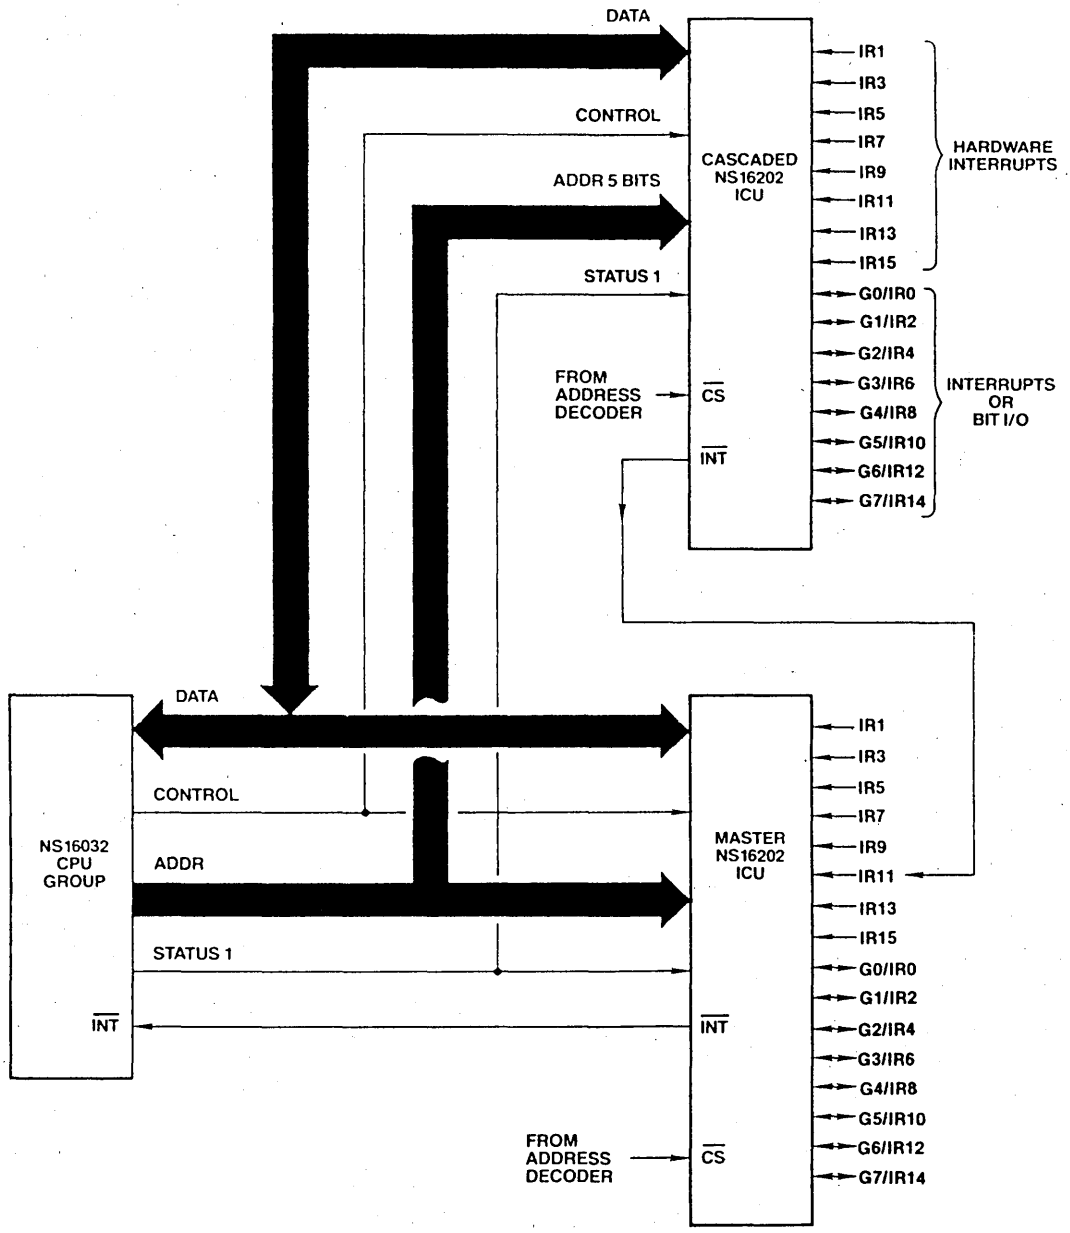

FIGURE 3-27. Cascaded Interrupt Control Unit Connections.

3.8.4 Non-Maskable Interrupt (The $\overline{\text{NMI}}$ Pin)

The Non-Maskable Interrupt is triggered whenever a falling edge is detected on the $\overline{\text{NMI}}$ pin. The CPU performs an "Interrupt Acknowledge, Master" bus cycle (Sec. 3.4.2) when processing of this interrupt actually begins. The Interrupt Acknowledge cycle differs from that provided for Maskable Interrupts in that the address presented is $FFFF00_{16}$. The vector value used for the Non-Maskable Interrupt is taken as 1, regardless of the value read from the bus.

The service procedure returns from the Non-Maskable Interrupt using the Return from Trap (RETT) instruction. No special bus cycles occur on return.

For the full sequence of events in processing the Non-Maskable Interrupt, see Sec. 3.8.7.1.

3.8.5 Traps

A trap is an internally-generated interrupt request caused as a direct and immediate result of the execution of an instruction. Traps recognized by the NS16032 CPU are:

Trap (FPU): An exceptional condition was detected by the NS16081 Floating Point Unit or another Slave Processor during the execution of a Slave Instruction. This trap is requested via the Status Word returned as part of the Slave Processor Protocol (Sec. 3.9.1).

Trap (ILL): Illegal operation. A privileged operation was attempted while the CPU was in User Mode (PSR bit U = 1).

Trap (SVC): The Supervisor Call (SVC) instruction was executed.

© IC MASTER 1983

Trap (DVZ): An attempt was made to divide an integer by zero. (The FPU trap is used for Floating Point division by zero.)

Trap (FLG): The FLAG instruction detected a "1" in the CPU PSR F bit.

Trap (BPT): The Breakpoint (BPT) instruction was executed.

Trap (TRC): The instruction just completed is being traced. See below.

Trap (UND): An undefined opcode was encountered by the CPU.

The Return Address pushed by any trap except TRC is the address of the first byte of the instruction during which the trap occurred. Traps do not disable interrupts, as they are not associated with external events.

A special case is the Trace Trap (TRC), which is enabled by setting the T bit in the Processor Status Register (PSR). At the beginning of each instruction, the T bit is copied into the PSR P (Trace "Pending") bit. If the P bit is set at the end of an instruction, then the Trace Trap is activated. If any other trap or interrupt request is made during a traced instruction, its entire service procedure is allowed to complete before the Trace Trap occurs. Each interrupt and trap sequence handles the P bit for proper tracing, guaranteeing one and only one Trace Trap per instruction, and guaranteeing that the Return Address pushed during a Trace Trap is always the address of the next instruction to be traced.

3.8.6 Prioritization

The NS16032 CPU internally prioritizes simultaneous interrupt and trap requests as follows:

1) Traps other than Trace (Highest priority)
2) Abort
3) Non-Maskable Interrupt
4) Maskable Interrupts
5) Trace Trap (Lowest priority)

3.8.7 Interrupt/Trap Sequences: Detailed Flow

For purposes of the following detailed discussion of interrupt and trap service sequences, a single sequence called "Service" is defined in Figure 3-28. Upon detecting any interrupt request or trap condition, the CPU first performs a sequence dependent upon the type of interrupt or trap. This sequence will include pushing the Processor Status Register and establishing a Vector and a Return Address. The CPU then performs the Service sequence.

For the sequence followed in processing either Maskable or Non-Maskable interrupts (on the $\overline{INT}$ or $\overline{NMI}$ pins, respectively), see Sec. 3.8.7.1. For Abort interrupts, see Sec. 3.8.7.4. For the Trace Trap, see Sec. 3.8.7.3, and for all other traps see Sec. 3.8.7.2.

3.8.7.1 Maskable/Non-Maskable Interrupt Sequence

This sequence is performed by the CPU when the $\overline{NMI}$ pin receives a falling edge, or the $\overline{INT}$ pin becomes active with the PSR I bit set. The interrupt sequence begins either at the next instruction boundary or, in the case of the String instructions, at the next interruptible point during its execution.

1) If a String instruction was interrupted and not yet completed:
   a) Clear the Procesor Status Register P bit.
   b) Set "Return Address" to the address of the first byte of the interrupted instruction.

   Otherwise, set "Return Address" to the address of the next instruction.
2) Copy the Processor Status Register (PSR) into a temporary register, then clear PSR bits S, U, T, P and I.
3) Push the PSR copy onto the Interrupt Stack as a 16-bit value.
4) If the interrupt is Non-Maskable:
   a) Read a byte from address $FFFF00_{16}$, applying Status Code 0100 (Interrupt Acknowledge, Master: Sec. 3.4.2). Discard the byte read.
   b) Set "Vector" to 1.
   c) Go to Step 9.
5) If the interrupt is Non-Vectored:
   a) Read a byte from address $FFFE00_{16}$, applying Status Code 0100 (Interrupt Acknowledge, Master: Sec. 3.4.2). Discard the byte read.
   b) Set "Vector" to 0.
   c) Go to Step 9.
6) Here the interrupt is Vectored. Read "Byte" from address $FFFE00_{16}$, applying Status Code 0100 (Interrupt Acknowledge, Master: Sec. 3.4.2).
7) If "Byte" ≥ 0, then set "Vector" to "Byte" and go to Step 9.
8) If "Byte" is in the range -16 through -1, then the interrupt source is Cascaded. (More negative values are reserved for future use.) Perform the following:
   a) Read the 32-bit Cascade Address from memory. The address is calculated as INTBASE + 4*Byte.
   b) Read "Vector," applying the Cascade Address just read and Status Code 0101 (Interrupt Acknowledge, Cascaded: Sec. 3.4.2).
9) Perform Service (Vector, Return Address), Figure 3-28.

Service (Vector, Return Address):

1) Push MOD Register onto the Interrupt Stack as a 16-bit value. (The PSR has already been pushed as a 16-bit value.)
2) Push the Return Address onto the Interrupt Stack as a 32-bit quantity.
3) Read the 32-bit External Procedure Descriptor from the Interrupt Dispatch Table: address is Vector*4 + INTBASE Register contents.
4) Move the Module field of the Descriptor into the MOD Register.
5) Read the new Static Base pointer from the memory address contained in MOD, placing it into the SB Register.
6) Read the Program Base pointer from memory address MOD+8, and add to it the Offset field from the Descriptor, placing the result in the Program Counter.

FIGURE 3-28. Service Sequence.
Invoked during all interrupt/trap sequences.

© IC MASTER 1983

3.8.7.2 Trap Sequence: Traps Other Than Trace

1) Restore the currently selected Stack Pointer and the Processor Status Register to their original values at the start of the trapped instruction.
2) Set "Vector" to the value corresponding to the trap type.

FPU:	Vector = 3.
ILL:	Vector = 4.
SVC:	Vector = 5.
DVZ:	Vector = 6.
FLG:	Vector = 7.
BPT:	Vector = 8.
UND:	Vector = 10.

3) Copy the Processor Status Register (PSR) into a temporary register, then clear PSR bits S, U, P and T.
4) Push the PSR copy onto the Interrupt Stack as a 16-bit value.
5) Set "Return Address" to the address of the first byte of the trapped instruction.
6) Perform Service (Vector, Return Address), Figure 3-28.

3.8.7.3 Trace Trap Sequence

1) In the Processor Status Register (PSR), clear the P bit.
2) Copy the PSR into a temporary register, then clear PSR bits S, U and T.
3) Push the PSR copy onto the Interrupt Stack as a 16-bit value.
4) Set "Vector" to 9.
5) Set "Return Address" to the address of the next instruction.
6) Perform Service (Vector, Return Address), Figure 3-28.

3.8.7.4 Abort Sequence

1) Restore the currently selected Stack Pointer to its original contents at the beginning of the aborted instruction.
2) Clear the PSR P bit.
3) Copy the PSR into a temporary register, then clear PSR bits S, U, T and I.
4) Push the PSR copy onto the Interrupt Stack as a 16-bit value.
5) Set "Vector" to 2.
6) Set "Return Address" to the address of the first byte of the aborted instruction.
7) Perform Service (Vector, Return Address), Figure 3-28.

3.9 SLAVE PROCESSOR INSTRUCTIONS

The NS16032 CPU recognizes three groups of instructions as being executable by external Slave Processors:

Floating Point Instruction Set
Memory Management Instruction Set
Custom Instruction Set

Each Slave Instruction Set is validated by a bit in the Configuration Register (Sec. 2.1.3). Any Slave Instruction which does not have its corresponding Configuration Register bit set will trap as undefined, without any Slave Processor communication attempted by the CPU. This allows software simulation of a non-existent Slave Processor.

Status Combinations:

Send ID (ID): Code 1111
Xfer Operand (OP): Code 1101
Read Status (ST): Code 1110

Step	Status	Action
1	ID	CPU Send ID Byte.
2	OP	CPU Sends Operation Word.
3	OP	CPU Sends Required Operands.
4	—	Slave Starts Execution. CPU Pre-fetches.
5	—	Slave Pulses $\overline{SPC}$ Low.
6	ST	CPU Reads Status Word. (Trap? Alter Flags?)
7	OP	CPU Reads Results (If Any).

FIGURE 3-29. Slave Processor Protocol.

3.9.1 Slave Processor Protocol

Slave Processor instructions have a three-byte Basic Instruction field, consisting of an ID Byte followed by an Operation Word. The ID Byte has three functions:

1) It identifies the instruction as being a Slave Processor instruction.
2) It specifies which Slave Processor will execute it.
3) It determines the format of the following Operation Word of the instruction.

Upon receiving a Slave Processor instruction, the CPU initiates the sequence outlined in Figure 3-29. While applying Status Code 1111 (Broadcast ID, Sec. 3.4.2), the CPU transfers the ID Byte on the least-significant half of the Data Bus (AD0-AD7). All Slave Processors input this byte and decode it. The Slave Processor selected by the ID Byte is activated, and from this point the CPU is communicating only with it. If any other slave protocol was in progress (e.g., an aborted Slave instruction), this transfer cancels it.

The CPU next sends the Operation Word while applying Status Code 1101 (Transfer Slave Operand, Sec. 3.4.2). Upon receiving it, the Slave Processor decodes it, and at this point both the CPU and the Slave Processor are aware of the number of operands to be transferred and their sizes. The operation Word is swapped on the Data Bus; that is, bits 0-7 appear on pins AD8-AD15 respectively, and bits 8-15 appear on pins AD0-AD7 respectively.

Using the Addressing Mode fields within the Operation Word, the CPU starts fetching operands and issuing them to the Slave Processor. To do so, it references any Addressing Mode extensions which may be appended to the Slave Processor instruction. Since the CPU is

© IC MASTER 1983

solely responsible for memory accesses, these extensions are not sent to the Slave processor. The Status Code applied is 1101 (Transfer Slave Processor Operand, Sec. 3.4.2).

After the CPU has issued the last operand, the Slave Processor starts the actual execution of the instruction. Upon completion, it will signal the CPU by pulsing $\overline{SPC}$ low. To allow for this, and for the Address Translation strap function, $\overline{AT}/\overline{SPC}$ is normally held high only by an internal pull-up device of approximately 5K ohms.

While the Slave Processor is executing the instruction, the CPU is free to prefetch instructions into its queue. If it fills the queue before the Slave Processor finishes, the CPU will wait, applying Status Code 0011 (Waiting for Slave, Sec. 3.4.2).

Upon receiving the pulse on $\overline{SPC}$, the CPU uses $\overline{SPC}$ to read a Status Word from the Slave Processor, applying Status Code 1110 (Read Slave Status, Sec. 3.4.2). This word has the format shown in Figure 3-30. If the Q bit ("Quit", Bit 0) is set, this indicates that an error was detected by the Slave Processor. The CPU will not continue the protocol, but will immediately trap through the FPU vector in the Interrupt Table. Certain Slave Processor instructions cause CPU PSR bits to be loaded from the Status Word.

The last step in the protocol is for the CPU to read a result, if any, and transfer it to the destination. The Read cycles from the Slave Processor are performed by the CPU while applying Status Code 1101 (Transfer Slave Operand, Sec. 3.4.2).

An exception to the protocol above is the LMR (Load Memory Management Register) instruction, and a corresponding Custom Slave instruction (LCR: Load Custom Register). In executing these instructions, the protocol ends after the CPU has issued the last operand. The CPU does not wait for an acknowledgement from the Slave Processor, and it does not read status.

3.9.2 Floating Point Instructions

Table 3-4 gives the protocols followed for each Floating Point instruction. The instructions are referenced by their mnemonics. For the bit encodings of each instruction, see Appendix A.

The Operand class columns give the Access Classes for each general operand, defining how the addressing modes are interpreted (see Programmer's Manual).

The Operand Issued columns show the sizes of the operands issued to the Floating Point Unit by the CPU. "D" indicates a 32-bit Double Word. "i" indicates that the instruction specifies an integer size for the operand (B = Byte, W = Word, D = Double Word). "f" indicates that the instruction specifies a Floating Point size for the operand (F = 32-bit Standard Floating, L = 64-bit Long Floating).

The Returned Value Type and Destination column gives the size of any returned value and where the CPU places it. The PSR Bits Affected column indicates which PSR bits, if any, are updated from the Slave Processor Status Word (Figure 3-30).

Table 3-4.
Floating Point Instruction Protocols.

Mnemonic	Operand 1 Class	Operand 2 Class	Operand 1 Issued	Operand 2 Issued	Returned Value Type and Dest.	PSR Bits Affected
ADDf	read.f	rmw.f	f	f	f to Op. 2	none
SUBf	read.f	rmw.f	f	f	f to op. 2	none
MULf	read.f	rmw.f	f	f	f to Op. 2	none
DIVf	read.f	rmw.f	f	f	f to Op. 2	none
MOVf	read.f	write.f	f	N/A	f to Op. 2	none
ABSf	read.f	write.f	f	N/A	f to Op. 2	none
NEGf	read.f	write.f	f	N/A	f to Op. 2	none
CMPf	read.f	read.f	f	f	N/A	N,Z,L
FLOORfi	read.f	write.i	f	N/A	i to op. 2	none
TRUNCfi	read.f	write.i	f	N/A	i to Op. 2	none
ROUNDfi	read.f	write.i	f	N/A	i to Op. 2	none
MOVFL	read.F	write.L	f	N/A	L to Op. 2	none
MOVLF	read.L	write.F	L	N/A	F to Op. 2	none
MOVif	read.i	write.f	i	N/A	f to Op. 2	none
LFSR	read.D	N/A	D	N/A	N/A	none
SFSR	write.D	N/A	N/A	N/A	D to Op. 1	none

NOTE:
D = Double Word
i = Integer size (B,W,D) specified in mnemonic.
f = Floating Point type (F,L) specified in mnemonic.
N/A = Not Applicable to this instruction

© IC MASTER 1983

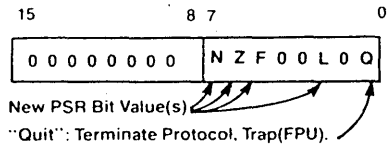

FIGURE 3-30. Slave Processor Status Word Format.

Any operand indicated as being of type "f" will not cause a transfer if the Register addressing mode is specified. This is because the Floating Point Registers are physically on the Floating Point Unit and are therefore available without CPU assistance.

3.9.3 Memory Management Instructions

Table 3-5 gives the protocols for Memory Management instructions. Encodings for these instructions may be found in Appendix A.

In executing the RDVAL and WRVAL instructions, the CPU calculates and issues the 32-bit Effective Address of the single operand. The CPU then performs a single-byte Read cycle from that address, allowing the MMU to safely abort the instruction if the necessary information is not currently in physical memory. Upon seeing the memory cycle complete, the MMU continues the protocol, and returns the validation result in the F bit of the Slave Status Word.

The size of a Memory Management operand is always a 32-bit Double Word. For futher details of the Memory Management Instruction set, see the Programmer's Manual and the NS16082 MMU Data Sheet.

Table 3-5.
Memory Management Instruction Protocols.

Mnemonic	Operand 1 Class	Operand 2 Class	Operand 1 Issued	Operand 2 Issued	Returned Value Type and Dest.	PSR Bits Affected
RDVAL *	addr	N/A	D	N/A	N/A	F
WRVAL *	addr	N/A	D	N/A	N/A	F
LMR *	read.D	N/A	D	N/A	N/A	none
SMR *	write.D	N/A	N/A	N/A	D to Op. 1	none

NOTE: In the RDVAL and WRVAL instructions, the CPU issues the address as a Double Word, and performs a single-byte Read cycle from that memory address. For details, see the Programmer's Manual and the NS16082 Memory Management Unit Data Sheet.

D = Double Word.
* = Privileged Instruction: will trap if CPU is in User Mode.
N/A = Not Applicable to this instruction.

© IC MASTER 1983

3.9.4 Custom Slave Instructions

Provided in the NS16032 is the capability of communicating with a user-defined, "Custom" Slave Processor. The instruction set provided for a Custom Slave Processor defines the instruction formats, the operand classes and the communication protocol. Left to the user are the interpretations of the Op Code fields, the programming model of the Custom Slave and the actual types of data transferred. The protocol specifies only the size of an operand, not its data type.

Table 3-6 lists the relevant information for the Custom Slave instruction set. The designation "c" is used to represent an operand which can be a 32-bit ("D") or 64-bit ("Q") quantity in any format; the size is determined by the suffix on the mnemonic. Similarly, an "i" indicates an integer size (Byte, Word, Double Word) selected by the corresponding mnemonic suffix.

For the instruction encodings, see Appendix A.

Table 3-6.
Custom Slave Instruction Protocols.

Mnemonic	Operand 1 Class	Operand 2 Class	Operand 1 Issued	Operand 2 Issued	Returned Value Type and Dest.	PSR Bits Affected

NS16081 Floating-Point Unit

General Description

The NS16081 is the Floating-Point Unit (FPU) in the NS16000 microprocessor family. The NS16081 operates as a slave processor, and the NS16081 instruction set appears to the programmer as part of the NS16000 instruction set. Thus, the user can utilize all the powerful addressing modes and data types present in the NS16000 architecture. The FPU performs both single-precision (32-bit) and double-precision (64-bit) floating-point arithmetic, and conforms to the proposed IEEE format. The FPU instruction set includes Add, Subtract, Multiply, Divide, and other popular arithmetic operations. The FPU is compatible with all microprocessors in the NS16000 family.

Features

- Both 32-bit and 64-bit operation
- Eight on-board, general-purpose, 32-bit registers
- Conforms to proposed IEEE format
- Accepts direct memory-to-memory operation
- High-speed execution—typical values (at 10MHz) are:

	32-bit	64-bit
Add	7.4 μs	7.4 μs
Multiply	4.8 μs	6.2 μs
Divide	8.9 μs	11.8 μs

- High-speed XMOS™ technology
- Single, +5V supply
- 24-pin package

NS16081 Pin Descriptions

Figure 1 is an NS16081 connection diagram. The function of each pin is described below.

D0-D15: Data input and output pins
VCC, GND: +5V, signal ground power pins
CLK: TTL-compatible clock input
$\overline{RST}$: Slave processor reset input
ST0, ST1: Status input lines (from CPU)
$\overline{SPC}$: Bidirectional slave processor communication line

NS16081
Dual-In-Line Package

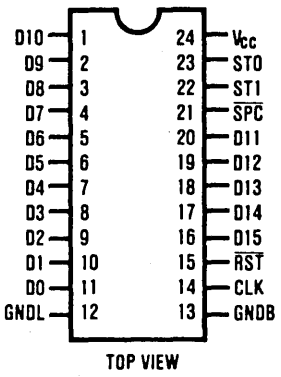

FIGURE 1. FPU Pinout OC1799-2

Functional Description

REGISTER SET

The NS16081 FPU has nine on-board, 32-bit registers. Eight are general-purpose registers and one is dedicated to FPU status. *Figure 2* illustrates the FPU register set layout.

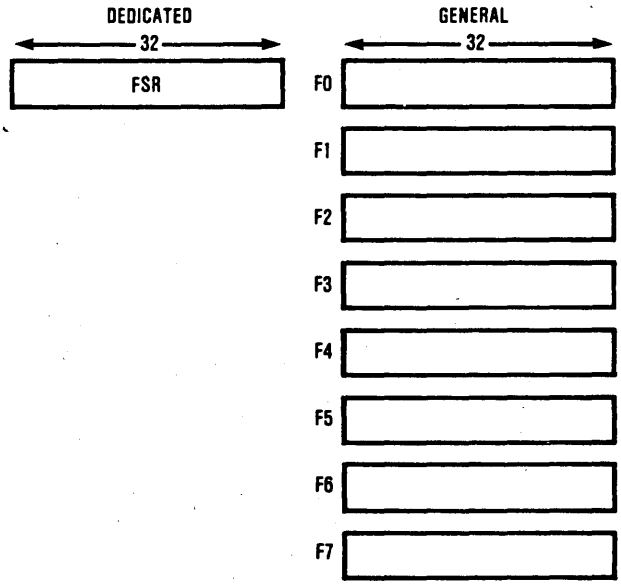

FIGURE 2. Register Set Layout OC1799-3

Each general-purpose register holds a 32-bit, single-precision, floating-point operand. For 64-bit, double-precision operation, a pair of general-purpose registers are concatenated. Register pairs consist of one even-numbered (N) and one odd-numbered (N+1) register. In double-precision operation, register pairs are identified by the even-numbered register of the pair.

Figure 3 shows the possible FPU floating-point formats.

The FPU Status Register (FSR) stores control and error data. Users can write control words to the FSR and read FPU operation and error status from the FSR.

The control options available via the FSR include enabling CPU traps, enabling FPU errors, and setting the rounding mode. Writing the FSR allows the user to specify one of the following rounding modes:

- Round to nearest
- Round towards zero
- Round towards + infinity
- Round towards - infinity

The error conditions reported via the FSR include the following:

- Underflow: If a result is too small (after rounding) to be represented as a normalized number, the FPU sets the underflow error bit in the FSR. If the trap enable bit is set, an underflow error traps the CPU. If the trap enable bit is not set, the result returned to the CPU is zero.
- Illegal Division: If a divisor is zero, the FPU generates a trap to the CPU.
- Illegal Instruction: If an undefined opcode is received, the FPU generates a trap to the CPU.
- Reserved Operand: If a reserved operand is received, the FPU generates a trap to the CPU.

Note: A reserved operand is defined as either an all-zero exponent, with the fraction not zero, or an all-one exponent.

- Inexact Result: The inexact result bit is set in the FSR if the result of an operation (after rounding) cannot be represented properly. If the trap enable bit is set, the FPU generates a trap to the CPU.

INSTRUCTION SET

The NS16081 FPU instruction set provides the following operations:

Add, Subtract, Multiply, Divide: These instructions provide basic arithmetic operations for two 32-bit or 64-bit operands.

Compare: This instruction compares the magnitude of two 32-bit or 64-bit operands and posts the results in the Processor Status Register (PSR) of the CPU. (Refer to each individual CPU's data sheet for details on the PSR.)

NS16082 Memory Management Unit (MMU)

General Description

The NS16082 Memory Management Unit (MMU) provides hardware support for demand-paged virtual memory management. Its specific capabilities include fast dynamic address translation, protection on individual 512-byte pages, and detailed status to assist an operating system in efficiently managing up to 16 MB of physical memory. Support for virtual machine implementations is provided, along with comprehensive software debugging features.

High-speed address translation is performed on-chip through a 32-entry associative cache, which maintains itself from tables in memory with no software intervention. Protection violations and page faults (references to nonresident pages) are automatically detected by the MMU, invoking the instruction abort with retry feature of the CPU. This fault handling mechanism provides the necessary hooks for virtual memory and virtual machines.

Additional features for program debugging include two hardware breakpoint registers and a program flow traceback facility, which provide the programmer with powerful stand-alone debugging capability even without expensive test equipment.

Features

- Dynamic address translation
- 32-entry on-chip translation cache, updated automatically from page tables in memory
- Full hardware support for virtual memory and virtual machines
- Security mechanisms implemented via access level checking and dual-space mapping
- Program debugging support:
  - — Two breakpoint registers
  - — "Break on Branch" mode
  - — Program flow traceback
- High-speed XMOS technology
- 48-pin dual-in-line package
- Single 5V supply

Absolute Maximum Ratings

Temperature Under Bias	0°C to 70°C
Storage Temperature	−65°C to 150°C
All Input or Output Voltages with respect to GND	−0.5V to +7.0V
Power Dissipation	1.5Watt

Note: Absolute maximum ratings are those values beyond which the safety of the device cannot be guaranteed. Continuous operation at these limits is not intended. Therefore, operation should be limited to those conditions specified under DC Electrical Characteristics (see below).

DC Electrical Characteristics $V_{CC} = 5V \pm 5\%$

Symbol	Parameter	Test	Min.	Max.	Unit
V_{IL}	Input Low Voltage		−0.5	+0.8	V
V_{IH}	Input High Voltage		2.0	$V_{CC}+0.5$	V
V_{OL}	Output Low Voltage	$I_{OL} = 2.0mA$		0.45	V
V_{OH}	Output High Voltage	$I_{OH} = -400\mu A$	2.4		V
I_{CC}	Power Supply Current	$T_A = 0°C$		300	mA
I_{IL}	Input Leakage Current	$0 < V_{IN} < V_{CC}$		10	μA
I_{OL}	Output Leakage Current	$0.45 < V_O < V_{CC}$		10	μA

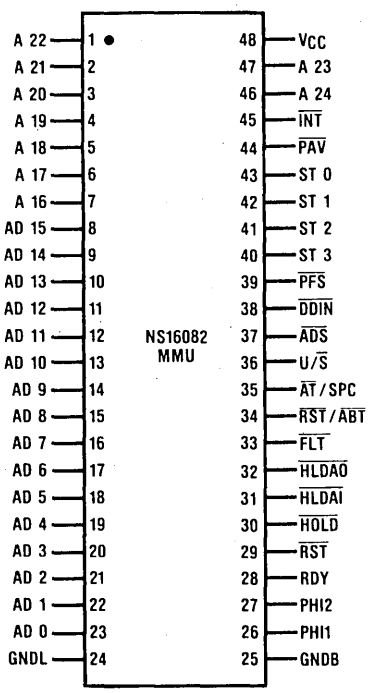
1 Pin Descriptions



Pin Configuration

1 Pin Descriptions

The following is a brief description of all NS16082 pins. The descriptions reference portions of the functional descriptions, Section 3.

1.1 Supplies

Power (V_{CC}): +4.75 to 5.25 V DC supply. (Sec. 3.1)

Logical Ground (GNDL): Internal Logic Common Ground. (Sec. 3.1)

Buffer Ground (GNDB): Signal Ground and Power Supply return. (Sec. 3.1)

1.2 Input Signals

Clock (PHI1, PHI2): Two-phase clocking signals from 0.5 to 10 MHz MOS Level clocks from NS16201 clock generator. See NS16032.

Ready (RDY): Used by slow memories to extend the memory cycle for more than four clock periods. It is synchronized externally and sampled at the beginning of T3.

Hold Request ($\overline{HOLD}$), ($\overline{HLDAI}$), ($\overline{HLDAO}$): Hold/Hold Acknowledge Input/Hold Acknowledge Output — three pins for active low signals used in DMA transfers. A DMA device requests the bus pulling the $\overline{HOLD}$ line low. $\overline{HLDAI}$ is connected to the $\overline{HLDA}$ output line of the CPU and $\overline{HLDAO}$ is output to the DMA device.

Reset ($\overline{RST}$): System reset, active low.

Status Lines (ST0-3): Status lines output by the CPU. Active from T4 of previous bus transfer through T3 of present bus transfer. See NS16032 Data Sheet for assignments.

Program Flow Status ($\overline{PFS}$): Active low pulse issued by the CPU at the beginning of each instruction.

User/Supervisor Modes (U/$\overline{S}$): This signal is provided by the CPU, from its U-bit in Program Status Register (PSR). It is used by the MMU for memory protection and for selection of the Address Space (in Dual Space mode only).

Address Strobe Input ($\overline{ADS}$): Active low pulse received from the CPU during T1. Used as a strobe to latch the virtual address from the multiplexed bus.

1.3 Output Signals

Reset Output or Abort ($\overline{RST}$/$\overline{ABT}$): Active low pulse accepted by the CPU during TMMU or T2. When active, the CPU is interrupted. The MMU status register (MSR) holds the information about the cause of the abort. When held longer than one clock cycle it is interpreted by the CPU as a reset signal. Upon receiving the $\overline{RST}$ signal on its own pin, the MMU will activate the $\overline{RST}$/$\overline{ABT}$ pin to reset the CPU.

Interrupt Output ($\overline{INT}$): Active low pulse used by the debug functions to inform the CPU (when connected to its $\overline{NMI}$ input) or external hardware that a break condition has occurred. The MMU status register (MSR) holds the information about the cause of the interrupt.

Float Output ($\overline{FLT}$): An active low signal that floats the CPU from the bus, when the MMU has to get Page Table Entries from memory. It is sampled by the CPU during TMMU. It is held high during reset.

Physical Address Valid ($\overline{PAV}$): Active low pulse generated during TMMU. Used as a strobe pulse by the memory address latches. It floats during HOLD ACKNOWLEDGE and it is also pulsed when $\overline{FLT}$ is active to access page tables.

Most significant bit of Physical Address (A24): Valid from TMMU to T4.

Hold Acknowledge Output ($\overline{HLDAO}$): See Hold Request. (Sec. 1.2)

1.4 Input-Output Signals

Multiplexed Address/Data Bus (AD0-AD15): During clock period T1, contains the Virtual Address (output by the CPU). During period TMMU contains the Physical Address (output by the MMU). During periods T2-T4 contains Data (output by the CPU, memory or MMU).

Virtual/Physical Address Multiplexed Bus (A16-A23): High-order bits of address. During T1, the bus contains the Virtual Address (output by the CPU). During TMMU-T4 it contains the Physical Address (output by the MMU).

Data Direction In ($\overline{DDIN}$): As an input indicates to the MMU the type of memory cycle: Low for Read and high for Write. When the CPU tri-states this line, the line is driven by the MMU allowing it to read/write in the memory pages independently of the CPU.

Address Translation or Slave Processor Control ($\overline{AT}$/$\overline{SPC}$): A bidirectional control line used in slave instructions. For a description of the characteristics of this line refer to the NS16032 CPU Data Sheet. During reset it is held low by the MMU to set the CPU for the Address Translation mode.

© IC MASTER 1983

2 General Description

For purposes of address translation, memory is divided into 512-byte pages. A virtual address for the MMU is composed of two fields: a virtual page frame number and a 9-bit offset. The offset is unchanged by the translation algorithm. The MMU translates the virtual page number to a physical page number, according to page tables stored in memory.

The Operating System and MMU exchange information on the status of the memory pages through a Page Table in physical memory. The entries track both the presence of a page in the physical memory and the protection level of that page.

By manipulating the page tables, an Operating System dynamically controls the mapping of virtual to physical addresses. In particular, the Operating System may specify that references to certain pages should generate translation error aborts. This mechanism implements virtual memory management and protection.

The virtual address output from the NS16032 CPU is 24 bits wide while the physical address output from the MMU is 25 bits wide. The extra bit (bit 25) can partition memory, making it especially useful in an In-System Emulation (ISE™) environment.

The MMU has an internal cache memory which contains direct virtual-to-physical address mappings of the 32 most recently used pages. Thus, most address translations take only one additional clock cycle. The "hit rate" of the cache memory is usually better than 98%, so that the time overhead involved in dynamic translation is minimal.

The MMU is also capable of debugging support. The MMU's ability to perform program flow tracing and address breakpoints aids debugging.

Program flow tracing allows software to reconstruct the sequence of instructions executed prior to an exception or a breakpoint. The address of a nonsequential instruction is stored and a count is kept of the number of instructions following until the next nonsequential instruction is reached. The MMU enables retracing of two such branchings with no effect on execution time. By enabling a special "Break on Nonsequential Fetch" feature, a table of arbitrary length can be maintained.

Up to two breakpoint addresses, virtual or physical, may be activated in the MMU. A counter may be attached to one of these, enabling "break on N occurances" capability.

2.1 Internal Organization

Internal organization of the NS16032 MMU consists of five functional blocks and their respective addressable registers. These are shown in *Figure 2-1*. Both internal and external MMU connections are shown in the block diagram. Detailed block and register operation is described in the following subsections.

2.1.1 Hardware Debug Block

This block contains the registers, counters, and logic which allow the execution of program breakpoints. The circuits also permit program flow tracing, which, in turn, enables the software to reconstruct the sequence of instructions executed before breakpoint.

Program flow tracing information is recorded in the two 24-bit Program Flow registers (PF0 and PF1). The 32-bit Sequential Counter (SC) contains the number of sequentially executed instructions following the last two program flow changes. The PF registers store the virtual addresses of the last two nonsequentially executed instructions. If such an address is obtained, it is entered into PF0. The old PF0 contents are shifted into PF1; the previous contents of PF1 are lost. The corresponding counts in the halves of SC are transferred similarly. For the user these are read-only registers read by means of the Store Memory Management Register (SMR) slave instruction. A Load Memory Management Register (LMR) instruction addressing any of the PF registers will reset the PF and SC registers.

The debug block includes the following registers. Each is described below. Particular emphasis is placed on the the MMU Status Register (MSR).

- MMU Status Register (MSR)
- Program Flow Registers (PF0 and PF1)
- Sequential Counter (SC)
- Breakpoint Registers (BPR0 and BPR1)
- Breakpoint Counter Register (BCNT)

Memory Management Status Register

The Memory Management Status Register (MSR) specifies the operational mode and current processing status of the MMU. The register permits user control of address translation, breakpoints, and program tracing. The MMU Status Register is 32 bits in length. The MSR format is shown on page 2.

Bits 0 to 25 are the various control bits and flags of the MMU. Bits 26 to 31 are not used. The following describes the control bits and flags:

ERC is the Error Class flag. The 3-bit flag specifies the cause of the current MMU exception.

Bit 0 is set to 1 on an address translation error.

Bit 1 is not used.

Bit 2 is set to 1 on a break and set to 0 on a nonsequential trace interrupt.

TET is the Translation Error Trace flag. The 3-bit flag specifies the cause of the current address translation error.

Bit 3 is set to 1 on a protection level error.

Bit 4 is set to 1 on an invalid Level 1 Page Table Entry.

Bit 5 is set to 1 on an invalid Level 2 Page Table Entry.

BN is the Breakpoint Number bit. BN is set to indicate the breakpoint address of the current break. If BN is 1, the breakpoint address is contained in BPR1. If BN is 0, the breakpoint address is in BPR0.

ED is the error Data Direction bit. If ED is 1, a read operation or the first part of a read-modify-write operation caused an address translation error. If

© IC MASTER 1983

ED is 0, a write or the last part of a read-modify-write operation caused the error.

BD is the Breakpoint Direction bit. If BD is 1, a read operation or the first part of a read-modify-write operation caused the current break. If BD is 0, a write operation on the last part of a read-modify-write operation caused the break.

EST is the Error Status flag. The 3-bit flag is set on an address translation error to the low order three bits of the system status bus. (See CPU Hardware Specs.)

BST is the Breakpoint Status flag. The 3-bit flag is set on a break to the low order three bits of the system status bus. (See CPU Hardware Specs.)

TU is the Translate User bit. If TU is 1, the MMU translates all adddresses specified in the User mode. If TU is 0, the MMU interprets addresses specified in the User mode as physical address.

TS is the Translate Supervisor bit. If TS is 1, the MMU translates all addresses specified in the Supervisor mode. If TS is 0, the MMU interprets addresses specified in the Supervisor mode as physical addresses.

DS is the Dual Space bit. If DS is 1, the PTB1 register contains the Level 1 Page Table Base address of all addresses specified in the User mode. If DS is 0, the PTB0 register contains the Level 1 Page Table Base address of all addresses specified in both User and Supervisor modes.

AO is the Access Override bit. If AO is 1, the MMU overrides the protection level of all addresses. This permits a program to access memory which is normally accessible only to the supervisor while the system is in the User mode. If A0 is 0, the MMU does not override protection level.

BEN is the Breakpoint Enable bit. If BEN is 1, the MMU enables the BPR0 and BPR1 registers and breaks program execution whenever a breakpoint is encountered. If BEN is 0, the MMU disables the BPR0 and BPR1 registers.

UB is the User Break bit. If UB is 1, the MMU enables the BPR0 and BPR1 registers for User mode operation only. If UB is 0, the MMU enables the registers for both User and Supervisor mode. The UB bit is ignored if breakpoints are disabled (BE = 0).

AI is the Abort or Interrupt bit.

FT is the Flow Trace bit. If FT is 1, the MMU enables the PF0, PF1, SC0, and SC1 registers and traces program execution. If FT is 0, the MMU disables the registers.

UT is the User Trace bit. IF UT is 1, the MMU enables the PF0, PF1, SC0, and SC1 registers for User mode operation only. IF UT is 0, the MMU enables the registers for both User and Supervisor mode. The UT bit is ignored if flow trace is disabled (FT = 0).

NT is the Nonsequential Trace bit. If NT is 1, the MMU enables the Nonsequential Trace interrupt. The MMU stops execution of any branch, jump, call, or return instruction and sends a non-maskable interrupt to the system CPU. If NT is 0, the MMU disables the interrupt.

The MSR control bits and flags may be read or modified by executing the SMR and LMR instructions. The NT, FT, TS, TU bits and the ERC flag are set to 0 whenever the system is reset. The NT, FT, and BEN bits are set to 0 whenever the MMU generates a break on a breakpoint, a flow trace interrupt, or an instruction abort on an address translation error.

After writing to the MSR, the MMU automatically suppresses the generation of breaks and flow tracing until a branch, jump, call, or return instruction has been executed. This permits a routine to set the MSR and

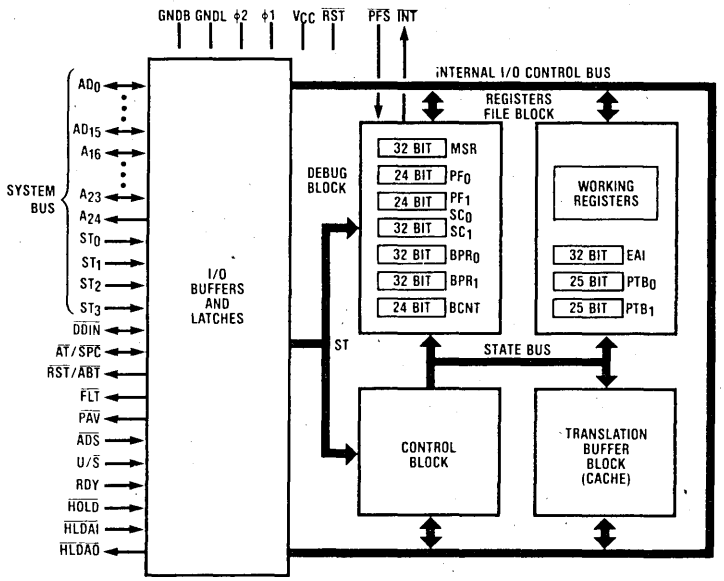


Figure 2-1. MMU Block Diagram

© IC MASTER 1983

then pass execution to the program being debugged without generating a premature break. The Error Memory Cycle Type (EMCT) is the combination of the BST, EST, BD and ED fields.

Program Flow Registers

The Program Flow registers PF0 and PF1 record the addresses of the two most recently executed nonsequential instructions. Nonsequential instructions are instructions to which execution control is passed by a program exception or a branch, jump, call, or return instruction.

The PF0 and PF1 registers are each 24 bits in length. PF0 contains the address of the last nonsequential instruction to be executed, and PF1 contains the address of the next to last nonsequential instruction to be executed.

The MMU records program flow by copying the address of the current nonsequential instruction to PF0 and copying the previous contents of PF0 to PF1. The MMU copies new addresses to the PF0 and PF1 registers each time a nonsequential instruction is executed by the system.

The FT bit in the MSR enables/disables the registers. If FT is 1, the registers record the program flow. If FT is 0, the registers are disabled.

The contents of the PF0 and PF1 registers may be read by executing the SMR instruction and cleared by executing the LMR instruction to any of the program flow registers.

Sequential Count Registers

The Sequential Count Registers SC0 and SC1 record the number of sequential instructions the system executes after each of the two most recent non-sequential instructions. The SC0 and SC1 registers occupy one 32-bit register and have the format shown on page 2.

SC0 contains the number of sequential instructions executed after the most recent nonsequential instruction. SC1 specifies the number of sequential instructions executed between the nonsequential instruction specified by PF1 and the instruction specified by PF0.

The MMU records the sequential count by incrementing by 1 the SC0 register for each sequential instruction executed. On execution of a nonsequential instruction, the MMU copies the contents of SC0 to SC1 and clears SC0 to 0 to begin a new count. The MMU continues to increment SC0 until another nonsequential instruction is executed or until SC0 is incremented to 65535. SC0 count cannot exceed 65535.

The FT bit in the MSR enables/disables the SC0 and SC1 registers. If FT is 1, the registers record the sequential instruction count. If FT is 0, the registers are disabled.

The contents of the SC0 and SC1 registers may be read by executing the SMR instructions and cleared by executing the LMR instruction to any of the program flow registers. The instructions treat the registers as a single 32-bit register with SC0 at the low order word, SC1 at the high order word.

Breakpoint Registers

The Breakpoint Registers BPR0 and BPR1 provide the breakpoint addresses and breakpoint conditions for system breaks. The registers are each 32 bits in length and have the format shown on page 2.

Bits 0 to 23 specify the breakpoint address. The MMU compares the breakpoint address with addresses referred to by the program. If a match is found and breakpoint conditions are met, the MMU sends a Nonmaskable interrupt to the system CPU and breaks program execution.

Bits 26 to 31 specify the breakpoint conditions (bits 24 and 25 are not used). Breakpoint conditions define how the MMU compares the breakpoint address and which conditions permit the MMU to generate breaks.

AS is the Address Space bit. If AS is 0, the MMU compares the breakpoint address with virtual addresses whose Level 1 Page Table is specified by the PTB0 register. If AS is 1, the MMU compares the breakpoint address with virtual addresses whose Level 1 Page Table is specified by the PTB1 register. If the VP bit is 1, the MMU takes the AS bit as bit 24 of the physical address.

VP is the Virtual/Physical bit. if VP is 0, the MMU compares the breakpoint address with virtual addresses only. If VP is 1, the MMU compares the breakpoint address with translated virtual addresses (i.e., final physical addresses) or physical addresses only.

BE is the Breakpoint Execution bit. If BE is 1, the MMU breaks program execution when the instruction at the breakpoint address is executed. The instruction must start at the breakpoint address for the break to occur. If BE is 0, no break occurs.

BR is the Breakpoint Read bit. If BR is 1, the MMU breaks execution when data is read from the breakpoint address. If BR is 0, no break occurs.

BW is the Breakpoint Write bit. If BW is 1, the MMU breaks execution when data is written to the breakpoint address or when data is read from the breakpoint address in the first part of a read-modify-write operation. If BW is 0, no break occurs.

CE is the Counter Enable bit (BPR0 only). If CE is 1, the Breakpoint Count register is enabled. If CE is 0, the register is disabled. The Breakpoint Count register is described in the next section.

Breakpoint Count Register

The Breakpoint Count Register (BCNT) controls the generation of the MMU interrupt signal to the CPU. It permits the user to specify the number of breakpoints the MMU should ignore before generating a break. The BCNT register is 24 bits in length.

The BCNT register affects system breaks only when it is enabled. The CE bit in the BPR0 register enables/disables the register. When the MMU encounters a breakpoint, it checks the CE bit in the register containing the breakpoint address. If CE is 1, the MMU decrements the contents of BCNT by 1, compares the new contents with

© IC MASTER 1983

zero. If the new contents are not equal to zero, the MMU ignores the breakpoint, i.e., it permits program execution to continue. If the contents are zero, the MMU breaks execution. If CE is 0, the MMU ignores the BCNT register and breaks program execution.

The user may set the register to any value within the range 0 to $2^{24}-1$ by executing an LMR instruction. If the register is not given a new value after a break, the next breakpoint decrements the register contents by 1.

2.1.2 Register File Block

This block contains a number of working registers, with no external access, used to execute the address translation algorithm. In addition, it has three addressable registers (PTB_0, PTB_1, and EAI) used in performing dynamic address translations.

Page Table Base Registers

The Page Table Base registers PTB0 and PTB1 specify the base addresses of the Level 1 Page Tables used in address translation. The PTB0 and PTB1 registers are each 32 bits in length and have the format shown on page 2.

Bits 0 to 23 specify the Page Table Base address. When a virtual address is translated, the MMU reads the base address from the register and accesses the specified Page Table. Bits 0 to 9 must be zeroes. Bits 24 to 30 are not used. Bit 31 is the Memory Space bit. It is intended to be used in system emulation.

The MMU accesses only one Page Table Base register for any given address translation. The current mode of system operation (User or Supervisor) and the Dual Space bit (DS) in the MSR specify which register is read. If the DS bit is 0, the MMU reads the base address from the PTB0 register when in either User or Supervisor mode. If the DS bit is 1, the MMU reads the base address from PTB1 when in User mode and reads the base address from PTB0 when in Supervisor mode.

The contents of the registers may be read or modified at any time by executing an SMR and LMR instruction.

Error/Invalidate Address Register

The Error/Invalidate Address register (EIA) is a dual purpose register that (1) holds a virtual address that has generated an MMU exception, and (2) when written to, removes page table entries from the MMU's Translation Buffer. The EIA is 32 bits in length.

The EIA permits examination of the virtual address that caused the current MMU exception. On an exception (such as a protection level error), the MMU copies the virtual address that generated the error to the EIA. The MMU sets bit 31 in the EIA to 1 if the address's Level 1 Page Table is specified by PTB1 and to 0 if the Level 1 Page Table is specified by PTB0. The error address may be read by executing an SMR instruction. The cause of the error is specified by the ERC and TET flags in the MSR.

The EIA also permits removal of invalid Page Table Entries from the MMU's Translation Buffer. The Translation Buffer contains a copy of the Level 2 Page Table Entries of recently accessed virtual addresses. A virtual address written to the EIA causes the MMU to remove the Page Table Entries of that virtual address from the Translation Buffer. Bit 31 of the EIA must be set to 1 if the address' Level 1 Page Table is specified by PTB1 and set to 0 if the Level 1 Page Table is specified by PTB0. Page Table Entries must be removed whenever the user modifies the corresponding entries in the page tables. The user may write to the EIA register using an LMR instruction.

2.1.3 Translation Buffer Block

The Translation Buffer is the cache memory of the chip. It provides direct virtual to physical address mapping for the most recently used pages in memory. Entries in the Translation Buffer are allocated and replaced by the MMU; the programmer is not involved in the process.

The Translation Buffer is a content-addressable memory. The virtual page frame number (the 15 high order bits of the virtual address) and the address space bit are compared to the entries in the buffer. If the virtual page frame number is present in the buffer, the mapped physical address is output immediately. If not, a control line is set, indicating to the Control Block that the memory page tables should be referenced. When this occurs, the MMU gets the corresponding mapping from memory and replaces the least recently used entry in the Translation Buffer with the new mapping.

Each entry in the Translation Buffer has, besides the virtual and physical page frame numbers and the address space bit, a copy of the protection level field (PL) and the modified bit (M) of the corresponding Page Table Entry. These bits are used by the MMU to implement the translation and error handling algorithms described in the Functional Description. The protection level field contains the most restrictive combination of the Level 1 and Level 2 PTE's.

2.1.4 Control Block

This block is made up of state machines and combinatorial logic. Each machine controls the sequence of operations taking place during the different MMU operations. A State Bus carries the operation code; the different blocks decode appropriate signals from the State Bus.

2.1.5 Input/Output Block

The Input/Output block consists of I/O buffers and internal buffers.

The I/O buffers provide the communication between the MMU and the outside system bus. The internal buffers between the I/O buses which transfer the address offset and the complete address in no-translation mode are also part of this block.

2.2 Memory Management Instructions

Format	Instruction		Description
14	LMR	mreg,gen	Load Memory Management Register. (Privileged)
14	SMR	mreg,gen	Store Memory Management Register. (Privileged)
14	RDVAL	gen	Validate address for reading. (Privileged)
14	WRVAL	gen	Validate address for writing. (Privileged)
8	MOVSUi	gen,gen	Move a value from Supervisor Space to User Space. (Priv.)
8	MOVUSi	gen,gen	Move a value from User Space to Supervisor Space. (Priv.)

The MOVSUi and MOVUSi instructions are intended for memory management. Instruction format detail can be found in the NS16032 Data Sheet, Appendix A.

3 Functional Description

3.1 Power and Grounding

The NS16082 requires a single 5V power supply applied to pin 48 (V_{CC}). See DC Electrical Characteristics.

Grounding connections are made on pins 24 and 25, Logic Ground Pin (GNDL) and Buffer Ground Pin (GNDB), respectively. GNDL is the common pin for on-chip logic, and GNDB is the common pin for the output drivers. As shown in *Figure 3-1*, GNDL is directly connected to GNDB with a single conductor.

All other grounding connections should be made only to GNDB (pin 25) to ensure optimum noise immunity.

3.2 MMU Operation

The MMU operation incorporates the following:

1. Bus Operation—related to Address Translation, DMA Transfers, Breakpoints on Physical Address, and Slave Operation
2. Slave Instruction Execution
3. Address Translation
4. Hardware Debugging
5. Error Handling

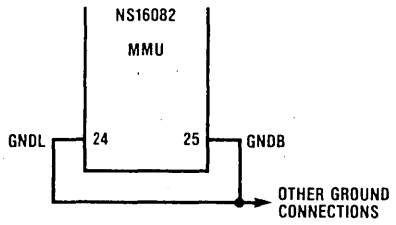

Figure 3-1. Grounding Connections

3.2.1 Bus Operation

Address Translation (see *Figures 3-2* to *3-5*): The MMU time-shares the address/data bus with the CPU. During a memory access cycle, the MMU reads the virtual address, performs the virtual to physical translation, and places the physical address on the bus. A typical memory cycle has five clock periods: T1, TMMU (time of physical address on the bus), T2, T3, and T4. The 16 A/D bus drivers of the MMU are in high impedance state at all times except during TMMU or when the $\overline{FLT}$ signal is active. The bus drivers of lines A16 to A24 drive the bus from TMMU through T4.

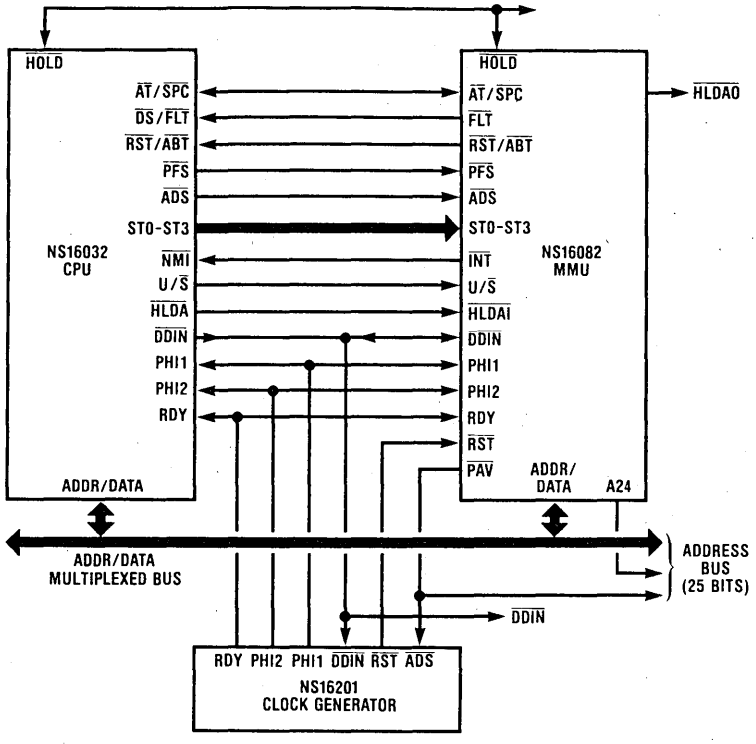

Figure 3-2. CPU, MMU Interconnections

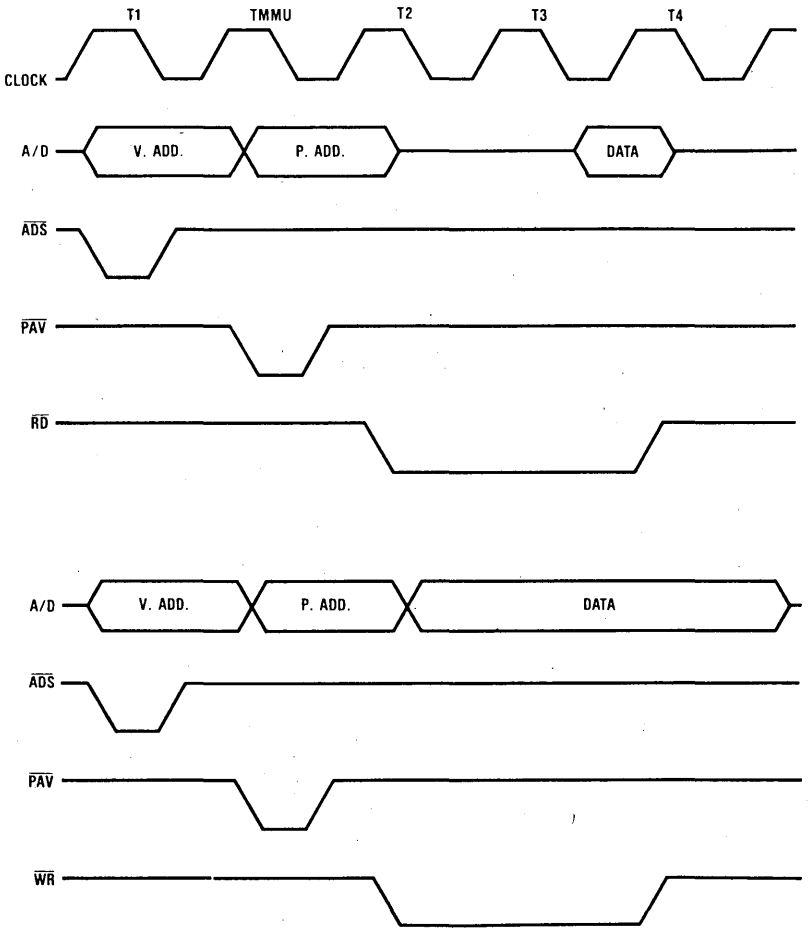

Figure 3-3. Bus Operation Timing: Virtual Address in Translation Buffer

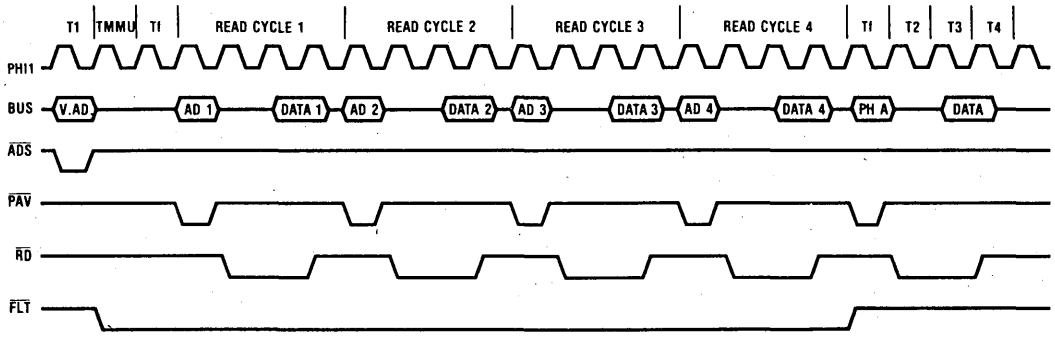

Figure 3-4. Bus Operation: Read Cycle When Virtual Address Is Not In Translation Buffer

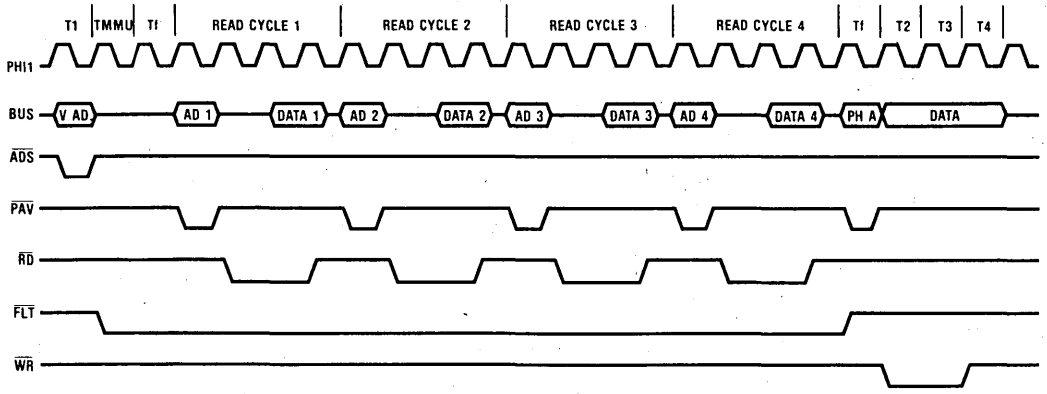

Figure 3-5. Bus Translation Write Cycle When Virtual Address Is Not In Translation Buffer

© IC MASTER 1983

During period T1, the CPU places on the bus the virtual address to be translated; this address is strobed into the MMU with the $\overline{ADS}$ pulse. During period TMMU, the CPU places the bus in high impedance and the MMU does one of two things. If the address to be translated is in the Translation Buffer, the MMU sends the physical address on the bus with a $\overline{PAV}$ timing pulse; if not, it takes the bus from the CPU with the $\overline{FLT}$ signal and executes four memory read cycles, to get the two double words needed to perform the translation algorithm. When necessary, the MMU executes two memory write cycles to update the referenced and modified bits in the Page Table Entry. It then releases control of the bus and sends the physical address on the bus. The memory cycle initiated by the CPU is resumed from the point it was stopped.

Between periods T2 and T4, there is data on the AD0-AD15 bus lines, output either by the CPU or memory. Bus lines A16 to A24 continue to hold the physical address.

DMA Transfers: The Hold and Hold Acknowledge lines are connected as shown in *Figure 3-6.*

The DMA device pulls the $\overline{HOLD}$ line low to request the bus; this line is input to both the CPU and the MMU. If the MMU is not floating the CPU (through the $\overline{FLT}$ line), the MMU transfers the $\overline{HLDA}$ CPU output directly to the $\overline{HLDAO}$ MMU output. If the MMU (when accessing the Memory Page Tables) is floating the CPU, the CPU cannot respond to $\overline{HOLD}$ request, $\overline{HLDAI}$ remains high, and the MMU grants the bus by pulling low $\overline{HLDAO}$ at the end of the present memory cycle. When the DMA device releases $\overline{HOLD}$, the MMU releases $\overline{HLDAO}$ and regains control of the bus.

Breakpoint on Physical Address: During debug, if a breakpoint is specified to occur on a physical address (VP is set in any BPR), an additional clock period is needed in the bus cycle. The additional clock period is required to make the address comparison after getting the physical address from the cache or page table. In this case the MMU floats the CPU for one clock period. This gives the memory cycles six periods: T1, TMMU, Tf, T2, T3, and T4. The corresponding waveforms are illustrated in the Timing Characteristics, *Figure 3-7.*

Slave Instruction Bus Operation: For slave instructions, the bus operation follows a different protocol. The bus cycle has only two periods (T1 and T4) and the timing is done by a one-clock-wide pulse on the Slave Processor Control ($\overline{SPC}$) bidirectional line. All bus transfers are illustrated in Timing Diagrams, *Figures 3-8* and *3-9.*

3.2.2 Slave Instructions

Introduction to Slave Instructions

The MMU Slave Instructions serve two purposes. First, slave instructions set up the different registers and check their contents (LMR and SMR instructions) in order to control the MMU mode of operation. Second, a slave instruction can request the MMU to return a flag indicating whether a specified access to a given address would generate a protection fault in user mode.

The general format for slave instructions appears in the NS16032 Microprocessor Data Sheet. The formats for the MMU slave instructions are described below.

Note: All MMU instructions are privileged. While in the User Mode, the CPU will trap on any MMU instruction.

MMU Slave Instruction Format

The 3-byte format of the MMU slave instruction is shown on page 2.

The format corresponds to the instructions as they are stored in memory; the CPU sends the operation word to the MMU with its bytes swapped, i.e., high byte in low bus byte and vice versa.

The short code assignments for the registers are shown below:

Code Value	Register
0000	BPR0
0001	BPR1
0100	PF0
0101	PF1
1000	SC
1010	MSR
1011	BCNT
1100	PTB0
1101	PTB1
1111	EAI/INVALIDATE

Note: All other short codes are illegal.

Address Translation Validation Instructions

The two instructions used to validate an address are: RDVAL address and WRVAL address. Both instructions consist of mnemonics and address type operands.

Upon receipt of a RDVAL or WRVAL instruction, the MMU checks if the address operand can be translated without protection violations in user mode (user space). If the address can be translated without violations, the MMU sends status word zero. If not, the MMU sends status word 32.

A trap is generated with error class 1 and error translation type 2 if the first Page Table Entry is invalid. No trap is generated if the second PTE is invalid or if protection violation errors occur.

A Validate instruction generates a status word which sets or resets a flag bit (F) in the CPU PSR register. This flag is positioned in bit 5. The remaining bits are all zero. Slave Instruction operation is shown in the following charts.

© IC MASTER 1983

RDVAL/WRVAL Instruction (Validate Read/Write Address)

CPU		MMU	
Execution Unit	**Bus Interface Unit**	**Status Pins**	**Action**
Sends ID Code in low byte	Sends ID Code with SPC timing pulse	1111	Recognizes ID Code
Sends Opcode in two bytes	Sends Opcode with SPC timing pulse	1101	Latches Opcode
Sends Address to be validated in two words (bits 24-31 set to zero)	Sends Address in two Write Slave cycles with SPC timing pulse	1101	
Generates Dummy Read with address to be validated	Starts a Read cycle with address to be validated	1010	Performs validation
	Detects MMU completion	0011	Signals completion SPC pulse
Reads MMU status	Reads MMU status word with SPC strobe	1110	Sends status word

LMR Instruction (Load MMU Register)

LMR short, read.d (See NS16000 Programmers Reference Manual, Document No. 420306565-001.)

The MMU register specified by first operand is loaded with the contents of the second operand. The instruction executes as follows:

CPU		MMU	
Execution Unit	**Bus Interface Unit**	**Status Pins**	**Action**
Sends ID Code in low byte	Sends ID Code with SPC timing pulse	1111	Recognizes ID Code
Sends Opcode in two bytes	Sends Opcode with SPC timing pulse	1101	Latches Opcode
Sends low word of operand	Sends low word of operand with SPC timing pulse	1101	Stores operand in low word of addressed register
Sends high word of operand	Sends high word of operand with SPC timing pulse	1101	Stores operand in high word of addressed register

SMR Instruction (Store MMU Register)

SMR short, write.d

The MMU register specified by first operand is stored in the second operand. The instruction executes as follows:

CPU		MMU	
Execution Unit	**Bus Interface Unit**	**Status Pins**	**Action**
Sends ID Code in low byte	Sends ID Code with SPC timing pulse	1111	Recognizes ID Code
Sends Opcode in two bytes	Sends Opcode with SPC timing pulse	1101 (See Note 1)	Latches Opcode
	Detects MMU completion	0011	Signals completion with SPC pulse
	Reads status with SPC strobe	1110	Sends zero status
	Strobes operand with the SPC pulse	1101	Sends low word of addressed register
	Strobes operand with SPC pulse	1101	Sends high word of addressed register

Notes:
1. The CPU may prefetch more code before this step.
2. After CPU reads the operand, the contents are stored in second operand according to the second operand addressing mode.
3. If addressed register is less than 32 bits, then the high order bits are reset to zero.

3.2.3 Address Translations

Page Table Entry (PTE) Format

Address translation is controlled by page tables contained in memory. A page table is a linear array of Page Table Entries. Each PTE defines the access characteristics of one page (512 bytes) of virtual storage. The PTE bit format is shown on page 2.

BS Bank select; most significant bit of PFN field.

PFN Page Frame Number; when the V bit is set, the PFN low field, together with the BS bit, contains the high order 16 bits of a physical page address which is used by the address translation algorithm.

M Modified; used only in index 2 (bits 9 to 15 of virtual address) PTE's and set when page mapped is modified.

R Referenced; set when page mapped by PTE is referenced.

PL Protection Level; Index 1 PTE and Index 2 PTE's control access to pages mapped by the PTE. The table below shows the relationship between User, Supervisor and protection level bit:

Mode	PSR bit 8	Protection Level Bits 00	01	10	11
User	1	no access	no access	read only	full access
Supervisor	0	read only	full access	full access	full access

V Valid bit; when set indicates that the corresponding page is resident in physical memory. When cleared, any attempted reference to the page will cause the MMU to abort the reference. If the V-bit is cleared, the PTE may be used by the Operating System for any desired function.

Note: Bits 7 and 8 are reserved for the user and are not affected by the MMU.

Address Translation Algorithm

The MMU translates the 24-bit virtual address generated by the CPU to either a 25-bit physical address or a translation error. This process is described below. See *Figure 3-10.*

The virtual address is divided into three components as shown on page 2.

The access level of a reference is a two-bit number whose logical expressions are:

bit 1 = U and AO

where AO = Access Override bit in MSR

bit 0 = 1 for write, read/modify/write, (RMW)

bit 0 = 0 for read

The detailed description of the translation algorithm follows. (See NS16000 Programmers Reference Manual 420306565-001.)

If TU = 0 and U = 1 or TS = 0 and U = 0, then PA = virtual address, else

1. Select first PTE:

   If DS (in MSR) = 1 and U (in PSR) = 1, then PTEP = PTB1 or Index 1 * 4

   else

   PTEP = PTB0 or Index 1 * 4

   end.

   Validate PTE:

   If access level is greater than (PTEP).PL or if (PTEP).V = 0, then abort CPU

   else

   Set (PTEP).R = 1

2. Select second PTE:

   PTEP = (PTEP).PFN * 512 or Index 2 * 4

   Validate PTE:

   If access level is greater than (PTEP).PL or if (PTEP).V = 0, then abort CPU

   else

   Set (PTEP).R = 1

   If writing, then set (PTEP).M = 1

3. Generate physical address:

   PA = (PTEP).PFN * 512 or Offset

   Legend:

   PA - Physical Address
   TU, DS, TS - MSR bits
   U - Program Status Register bit (sent to MMU via the U/S pin)
   PTEP - PTE pointer
   (PTEP).PL - represents protection level in Page Table Entry
   (PTEP).V - represents valid bit in Page Table Entry
   (PTEP).M - represents modified bit in Page Table Entry
   PFN - Page Frame Number

The MMU marks bits R and M of the PTE for subsequent use by the operating system. If a physical page is written upon, it is assumed that the user intends for this modification to be permanent in his storage system. The M bit indicates whether a page needs to be written to mass storage when it is deallocated from physical memory. The R bit is tested and cleared periodically by the operating system in order to compile statistics of the frequency of references to each page currently in memory. It will use this information to deallocate the least frequently used pages when new pages must be called in.

Page tables that refer to physical pages are themselves referenced by two page tables of double length. Selection of the PTB0 or PTB1 register depends on the Dual Space (DS) and User/Supervisor (U/S) modes as shown below:

DS \ U/S	0	1
0	PTB0	PTB0
1	PTB0	PTB1

© IC MASTER 1983

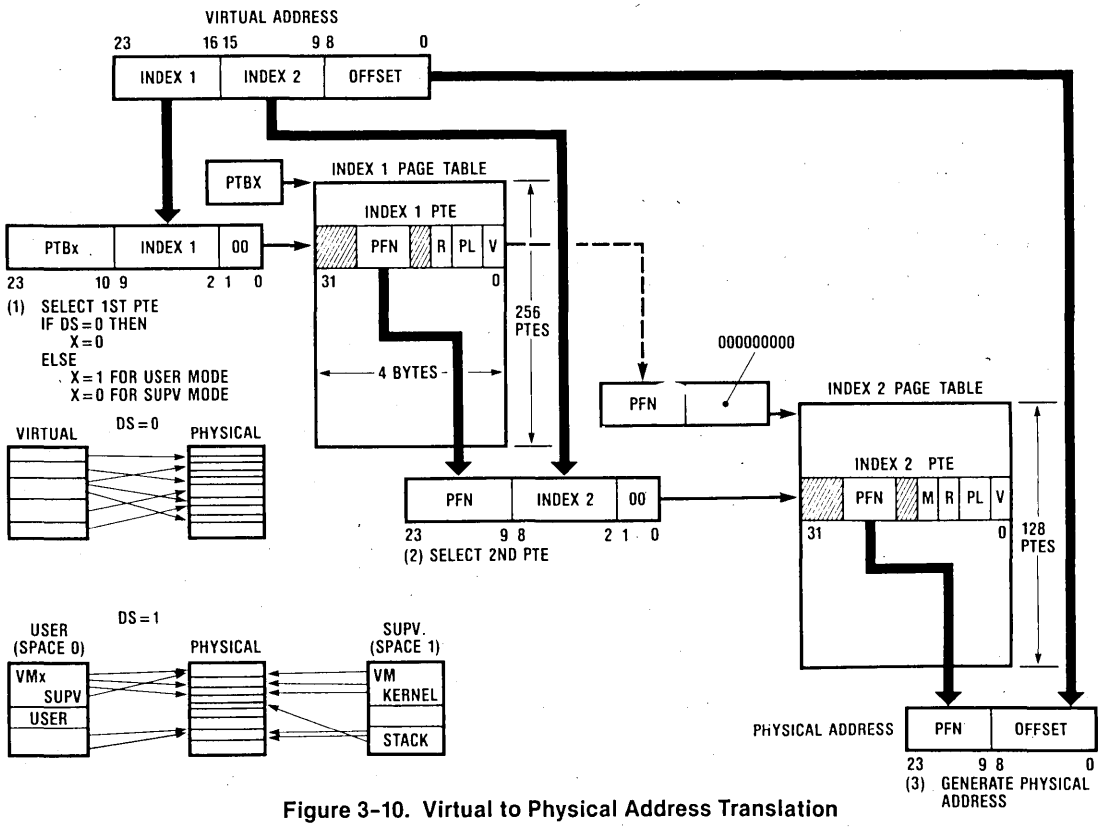

Figure 3-10. Virtual to Physical Address Translation

Page Table Base (PTB) Registers

PTB0 and PTB1 registers are specified as double words. The BS bit is used by the MMU to produce the 25th bit of the physical addresses pointing to the entries in the first translation table. Their format is given on page 2.

3.2.4 Hardware Debugging

The MS16082 MMU incorporates two special debugging facilities: program flow tracing and breakpointing.

Program Flow Tracing: Program Flow Tracing allows the software to reconstruct the sequence of exception executed prior to a certain instruction or breakpoint. Registers PF0, PF1 and SC are used to record program flow information. The SC register is divided into two 16-bit fields (SC0 and SC1). SC0 is also a 16-bit counter. For the user, these are read-only registers which can be read via an SMR slave instruction. An LMR instruction addressing any of the PF registers resets all of them.

When a sequential instruction is executed, a PFS pulse is received form the CPU for acknowledgement. This pulse is also used to increment the SC0 counter.

When a nonsequential instruction is fetched, the content of register PF0 is copied into PF1 and that of SC0 into SC1; then the virtual address of this instruction is stored in PF0 and the SC0 counter is reset. This happens only if before the fetch the SC0 content was not zero (to prevent multiple tracing for instructions which cause more than one queue flush, e.g., ACBI), and bits FT and UT in the MSR register were set.

Note: When the SC0 counter reaches 64k minus 1, it stops counting.

Entry To and Exit From a Debugged Program: When the MSR is written to, debugging traps are disabled. At the end of the second nonsequential fetch cycle they are enabled. This feature enables entry to a debugged program from a monitor or debugger after the flushing of the queue and a nonsequential fetch. This will occur normally without getting an immediate trap if bit NT is set.

After a debugging trap, the MSR bits which enable this trap (NT, BEN) are cleared, thus inhibiting further debug traps until the MSR is rewritten by the monitor or debugger program. Bit FT in the MSR is also cleared thus freezing the program tracing. This last feature inhibits the tracing of useless information (like the program flow inside the monitor or debugger), until the program tracing registers are read.

Breakpoints: A breakpoint generates an abort or interrupt pulse when a software specified address is referenced under software controlled conditions. It also updates the ERC and BN fields in MSR. Breakpoints are controlled by the BEN and UB bits (in MSR) and the BPR registers which have the format shown on page 2.

© IC MASTER 1983

Breakpoint on Execution Fetch mechanism: When a sequential instruction is fetched by the CPU, the instruction is placed in the queue. Unless the queue is empty, aborts on queue fetches are not received and so a breakpoint could be missed. The proper operation of breakpoint execution requires flushing the queue, as described below.

When the BE bit is set and the location specified in the BPR is accessed in a nonsequential fetch, an Abort or INT pulse is generated.

When the BE bit is set and the location specified in the breakpoint register is accessed in a sequential fetch (or in a nonsequential fetch from an even-numbered address (2n) and the location specified in BPR is (2n + 1), the MMU returns a DIA instruction instead of the memory byte at the breakpoint location. This is preceded by a read cycle in order to return the other original byte from memory. This causes the CPU to flush the queue and to fetch the instruction a second time, now with a nonsequential fetch status.

The BPR bit functions are tabulated below:

AS Address Space; virtual address when VP = 0, bank select bit of physical address when VP = 1.

VP Virtual or Physical address; if VP is set, address field is matched against physical address. If VP is reset, address field is matched against virtual address.

BE Breakpoint on Execution; if BE is set, a breakpoint occurs when the location specified in ADDRESS field is referenced in an instruction fetch cycle (instruction execution detailed below).

BR Breakpoint on Read operand; if BR is set, a breakpoint occurs when the location specified in ADDRESS field referenced in a read operand cycle.

BW Breakpoint on Write operands; if BW is set, a breakpoint occurs when the location specified in ADDRESS field is referenced in a write or RMW operand cycle.

CE Counter Enable (BPR0 only); the 24-bit BCNT counter decrements when Counter Enable bit (CE) is set and the conditions for a breakpoint in register BPR0 are obtained. When this counter reaches zero, an "abort" or INT pulse is generated by the MMU.

Note: An erroneous count will result if both the CE and BW bits are set.

3.2.5 Error Handling

Traps are serviced according to class and type (c, t) as follows:

In the MSR register, the appropriate bit in the ERC field is set due to the fact that RMW accesses are counted twice.

For Address Translation Error, the following bits are set in the TET field:

If access level is greater than (PTEP).PL	bit 0 set
If (PTEP).V = 0 in Index 1 PTE	bit 1 set
If (PTEP).V = 0 in Index 2 PTE	bit 2 set

In the EMCT field set the CPU status and DDIN bits.

In the EAI register, set AS bit to designate the address space PTB0/PTB1 of virtual address being translated and set the address field to the value of the virtual address being translated, as shown in the register format shown on page 2.

For Breakpoint Error, the following bits are set in the MSR register:

BN field — the number of the appropriate breakpoint register

EMCT field — CPU status and DDIN bits

4 AC Electrical Characteristics

4.1 Definitions

All the timing specifications given in this chapter refer to 50% of the leading or trailing edges of the appropriate clock phase and 0.8V or 2.0V on the appropriate signal as illustrated in *Figures 4-1* and *4-2*, unless specifically stated otherwise.

NS16201-6 Timing Control Unit

General Description

The NS16201 Timing Control Unit (TCU) is a 24 pin device fabricated on a schottky bipolar process. It provides the 2 phase MOS clock drivers, system control logic (read, write, and data buffer enable) and cycle extension logic for the NS16000 family.

A crystal or external signal may be used as the 2X frequency source. Besides the 2 phase MPU clock outputs (PHI1 and PHI2), there are two other clock outputs (TTL compatible) available for system timing use. One of these is a fast clock (FCLK), at twice the MPU clock frequency (i.e., at the crystal frequency). The other is a TTL version of PHI1 (CTTL).

The cycle extension features include:

* Digitally programmable wait state inputs ($\overline{WAITn}$)
* Peripheral (Slow) cycle to accomodate slower MOS peripheral interface ICs (where just adding wait states is not adequate)
* Cycle Hold between the first (T1) and second (T2) timing states to allow additional time for arbitration prior to generating control signals.

Features

* 2 phase full-VCC swing high capacitance clock drivers
* 4 bit input ($\overline{WAITn}$) allowing precise specification of from 0 to 15 wait states
* Cycle Hold for system arbitration and/or memory refresh
* System timing (CTTL & FCLK) and control ($\overline{RD}$, $\overline{WR}$, & $\overline{DBE}$) outputs
* General purpose Timing State Output ($\overline{TSO}$) that identifies internal states
* Support of slow MOS peripheral interface ICs (e.g., 8080 series)
* Provides "ready" (RDY) output for NS16000 MPUs
* Synchronous system reset generation from Schmitt trigger input
* Single 5V power supply
* 24 Pin Dual-In-Line Package

NS16201 Functional Pin Descriptions

SUPPLIES

VCC (24): +5V Power Input

GND (12): 0V Power Return

A 0.1uf ceramic decoupling capacitor must be connected across VCC and GND as close to the device as possible (i.e., with least amount of lead and trace resistance). This is not only good layout practice but necessary due to the high current transients delivered by the PHI1 and PHI2 outputs.

CLOCK PINS

XIN (13): Crystal or External Frequency Source Input
The desired MPU clock (PHI1 and PHI2) frequency will be half that of the crystal or external source. A schottky series gate (VOH(min)=2.7V) is recommended to drive XIN (Vthreshold=2.5V) as the external frequency source.

XOUT (14): Crystal Feedback Output
This output is used in crystal operation only. It must be left open when driving XIN with an external frequency source.

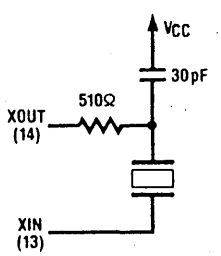
Crystal Oscillator Characteristics:

The 16201 has a "Pierce" type oscillator that requires a parallel resonant crystal. Connections of the crystal and bias components to XIN and XOUT are shown below. It is important that the crystal be mounted in close proximity to the XIN and XOUT pins to keep printed circuit trace lengths to an absolute minimum.

Typical Crystal Specifications

Type	At-Cut
Tolerance	0.005% at 25°C
Stability	0.01% from 0°C to 70°C
Resonance	Fundamental (parallel)
Capacitance	20pf
Maximum Series Resistance	50ohms

CRYSTAL CONNECTION DIAGRAM



© IC MASTER 1983

National Semiconductor

NS16201

FCLK (15): Fast Clock Output
This is a TTL level clock output at the same frequency as the crystal or external frequency source. Consequently its frequency is twice that of the MPU clocks.

PHI1(11) and PHI2(10): MPU Clock Outputs
These outputs provide the NS16000 series MPUs with two-phase non-overlapping MOS (full VCC swing, high capacitive drive) clock signals. Their frequency will be half that of the crystal or external source.

CTTL (16): TTL System Clock
This is a TTL output version of PHI1. Therefore, it operates at the MPU clock frequency.

CONTROL PINS

$\overline{\text{RSTI}}$ (7) and $\overline{\text{RSTO}}$ (8): Reset Input and Reset Output
$\overline{\text{RSTI}}$ is a Schmitt trigger input that will generate the synchronous system reset signal, $\overline{\text{RSTO}}$. $\overline{\text{RSTO}}$'s rising edge is synchronized to PHI1 to satisfy the MPU's requirements. $\overline{\text{RSTI}}$ going low will cause RSTO to go low, signaling a system reset. When the slow ramping rising edge (via external RC combination) of $\overline{\text{RSTI}}$ reaches the Schmitt trigger threshold, $\overline{\text{RSTO}}$ will go high on the next rising edge of PHI1.

$\overline{\text{ADS}}$ (6): Address Strobe input from MPU/MMU
This input (going low) identifies the first timing state (T1) of a bus cycle for the TCU (see Note (1)).

$\overline{\text{DDIN}}$ (5): Data Direction Input
This signal determines whether a Write (when high) or a Read (when low) cycle will be performed. It is connected to the MPU's $\overline{\text{DDIN}}$ output pin in a normal configuration.

$\overline{\text{RD}}$ (3): Read Output Strobe (TRISTATE)
This is an active low signal that identifies a Read cycle. It is decoded from $\overline{\text{DDIN}}$ and tristated by $\overline{\text{RWEN}}$.

$\overline{\text{WR}}$ (4): Write Output Strobe (TRISTATE)
This is an active low signal that identifies a Write cycle. It is decoded from $\overline{\text{DDIN}}$ and tristated by $\overline{\text{RWEN}}$.

$\overline{\text{RD}}$ and $\overline{\text{WR}}$ are mutually exclusive (active low) in any cycle.

$\overline{\text{RWEN}}$ (2): Read/Write Enable input
This input tristates the $\overline{\text{RD}}$ and $\overline{\text{WR}}$ outputs when high and enables them when low.

Notes: (1) The MPU and TCU view some timing states (T-states) differently. For clarity, references to T-states will sometimes be followed by (TCU) or (MPU). (MPU) also implies (MMU).

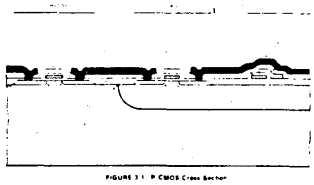
NS80CX48/80CX35 P²CMOS™ Microcomputer/ Microprocessor Family



General Description

The NS80CX48 is a parallel 8-bit microcomputer contained in a standard 40-pin, dual-in-line package. The device is fabricated using P²CMOS silicon gate technology. This technology provides the system designer with devices that equal the speed performance levels of comparable NMOS products, combined with low-power advantages of CMOS. The NS80CX48 is a stand-alone microcomputer designed for efficient controller applications. It executes powerful bit manipulative instructions and BCD as well as binary arithmetic. The NS80CX48 contains on-chip oscillator and clock circuits, 1K x 8 ROM program memory, 64 x 8 RAM data memory, 27 I/O lines, and an 8-bit Timer/Counter. Also, it is pin and instruction compatible with the XMOS™ INS8048.

The NS80CX48 has an extra feature mode which permits enhanced microcomputer performance. When the NS80CX48 is not in the extra feature mode, the device operates the same as the standard INS8048. Device capabilities can be expanded using readily available compatible components. The NS80CX35 is a ROMless version of the NS80CX48.

Features — NS80CX48

- 8-Bit CPU, RAM, ROM, I/O in a Single Package
- 2.5 μsec Cycle Time, 6MHz Oscillator
- Low Power
- Very Low Stand-by Power
- Expandable Memory and I/O
- Single-Level Interrupt
- Efficient Instructions
- Instruction Compatible to INS8048
- Pin Compatible to INS8048

Extra Features

- Programmable Prescaler for Timer/Counter
- Gating Mode for Timer/Counter
- Modulo Mode for Timer/Counter
- Power Down Mode (Idle Mode)

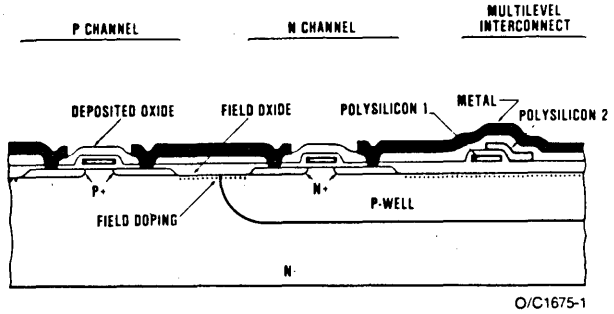
NS87PC48 Piggy-Back Microcomputer



O/C1675-1

General Description

The NS87PC48 Piggy-Back 8-bit Microcomputer is a prototyping aid for NS80C48 and NS80CX48 designs. It is fabricated using National's P²CMOS™ silicon gate technology. This technology provides the system designer with devices that equal the speed performance levels of comparable NMOS products, combined with low-power advantages of CMOS. Housed in a 40-pin dual-in-line package, the NS80PC48 includes a plug-in adapter that will accept either a 27C16 or a 27C58A EPROM.

The NS87PC48 Piggy-Back Microcomputer contains the system timing, control logic, RAM data memory and EPROM socket, plus 27 I/O lines to implement prototype program development and emulation. It has extensive bit handling capability as well as facilities for both binary and BCD arithmetic. Efficient use of program memory is derived from an instruction set comprised of predominantly single-byte instruction; the remaining instructions are two bytes in length. It also has an extra feature mode which permits enhanced microcomputer performance. When not in the extra features mode, the device operates the same as the standard INS8048.

Features - NS87PC48

- 8-Bit CPU, RAM, ROM, I/O in Single Package
- 2.5 μsec Cycle Time, 6MHz Oscillator
- Low Power
- Very Low Standby Power
- Expandable Memory and I/O
- Single-Level Interrupt
- Efficient Instructions
- Instruction Compatible to INS8048
- Pin Compatible to INS8048

Extra Features

- Programmable Prescaler for Timer/Counter
- Gating Mode for Timer/Counter
- Modulo Mode for Timer/Counter
- Power Down Mode (IDLE Mode)

Piggy-Back Package

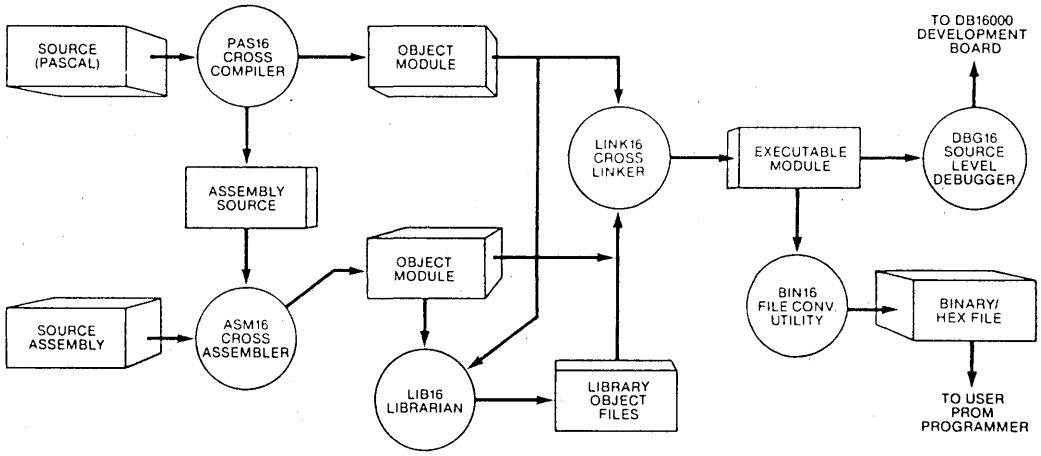
NSX16 Cross Software Package



NSX16 Cross Software Package

- **Runs under STARPLEX II™ operating system and DEC® VAX/VMS operating system**
- **Compatible with ANSI standard Pascal**
- **Supports NS16081 floating point unit**
- **Pascal run-time support environment for DB16000 development board**
- **Pascal compiler produces NS16000 code directly**
- **High-level symbolic debugger allows debug at source level**

Product Overview

NSX16 is a comprehensive software development package that includes all the components necessary to produce NS16000 native code. Intended as a support package to facilitate the development of software for NS16000-based systems, NSX16 has been designed to run initially on two hardware configurations. These are National Semiconductor's STARPLEX II operating system and Digital Equipment's VAX11 series running the VMS operating system.

Consisting of a Pascal compiler, NS16000 cross-assembler, linker, librarian, and source-level debugger, NSX16 provides the full ensemble of tools to make the generation of NS16000 code an easy task. Code thus developed may then be downloaded via a serial port to the DB16000 development board for execution and debug.

NSX16 consists of the following components:

— PAS16, the Pascal Cross-Compiler
— RTS16, the Run-Time Support Package
— ASM16, NS16000 Cross-Assembler
— LINK16, the Cross Linker
— LIB16, the Librarian
— BIN16, the File Conversion Utility
— DBG16, the Source-Level Symbolic Debugger

PAS16

Designed to be compatible with the ANSI standard, with listed extensions and restrictions, the Pascal cross-compiler is capable of accepting compatible Pascal source and generating NS16000 code. Extensions include features such as IMPORT/EXPORT in support of full modularity and FAST variables for code optimization. Also included is the run-time support environment for the DB16000 development board.

ASM16

The cross-assembler produces relocatable NS16000 object code. It accepts complex expressions, floating point scientific notation, external symbol references and can handle external address arithmetic.

LINK16

Modules generated by the cross-compiler or assembler are linked by LINK16 to produce executable modules. LINK16 is interactive, allowing the user to include additional files and libraries at link time whenever symbol matching is unsuccessful. LINK16 provides an extensive repertoire of directives to support complex system configurations. Directives can be entered from disk or directly from the console. LINK16 permits user control of RAM/ROM allocation.

DA-B30M72/Printed in U.S.A.

© IC MASTER 1983

National Semiconductor

NSX16

LIB16

The librarian maps module characteristics and builds module libraries.

BIN16

The BIN16 program is a utility that converts 16000 executable files into a format acceptable for PROM programmers.

DBG16

DBG16 is an interactive symbolic debugger that allows debugging at the source level. It communicates with the DB16000 monitor via a serial link allowing execution and debug on the board. Source code may be displayed and breakpoints set by line numbers. Single-stepping is possible at the machine instruction level, the Pascal statement level, the procedure level, or until a register/address value match occurs. DBG16 supports debugging of multimodule programs, drawing all information needed to support debug from source files and the output of the linker. It supports command files and output to a file to serve as a history file.

Supported Hardware

— STARPLEX II™
STARPLEX™ Operating System
— DEC® VAX 11 Family
VMS Operating System Vers 2.X or later

Shipping Package

VAX Version:
1600 bpi mag tape (9-track VMS copy format)
User and reference documentation

STARPLEX II Version:
Compatible diskette
User and reference documentation

Order Information

NSX-16	Cross Software Package, VAX/VMS version (Includes PAS16, RTS16 ASM16, LINK16, LIB16, BIN16 and DBG16)
NS-PAS-16	Pascal Cross-Compiler, VAX/VMS version
NS-ASM-16	NS16000 Cross-Assembler, VAX/VMS version (Includes ASM16, LINK16, LIB16, BIN16 and DBG16)
SFW-90-A500	Cross Software Package, STARPLEX II version (Includes same as NSX-16)
SFW-90-A400	Pascal Cross-Compiler, STARPLEX II version
SFW-90-A010	NS16000 Cross-Assembler, STARPLEX II version (Includes same as NS-ASM-16)

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

The 1800 Series — Unique and Versatile

The 1800-Series has found its way into a wide variety of applications in the last several years — applications that make optimum use of its low power and architectural characteristics. Since the virtues of CMOS as a technology are well known in the industry, it is more beneficial to concentrate on the internal architecture and external interfacing features of the 1800-series family and how they can prove useful in your system design.

Register-Based Addressing and Data Storage

The register-based addressing-and-data storage concept is the prime feature that sets the 1800 series apart from many other CPU structures. Contained on the CPU chip is an array of sixteen 16-bit scratchpad registers that provide control over memory addressing and internal housekeeping. The user has a variety of software instructions available to program this scratchpad indirectly by use of three 4-bit register designators (P, N, and X). The designators select the scratchpad registers to be program counters, stack pointers, memory pointers, loop counters, or storage locations (8 or 16 bit) for variable data. (Fig. 1) Once the user has mapped out a register assignment plan, a rich variety of software techniques is possible, since the register designators can be changed at will. Multiple program counters for quick subroutine calls, multiple stacks for I/O, data, and context switching, and multiple memory pointers for low-software-overhead data transfers can be facilitated. Since all scratchpad registers are 16 bits wide, the registers can address any of the 64K memory locations available to CDP1800-series CPU's.

Manipulation of data in the scratchpad registers is through the D register (accumulator) in the case of the CDP-1802 microprocessor family. (Fig. 2) Enhanced register data transfer — directly from program memory or to or from data memory — is possible with the CDP1804 microcomputer family. (Fig. 3) Treatment of the scratchpad register array as a 256-bit memory can reduce external memory requirements and allow for convenient storage of interim data.

Addressing Modes

The 1800-series architecture features indirect addressing as its primary addressing mode. Memory locations are addressed by loading address values into the scratchpad registers, which are selected by the 4-bit designator indicated within the instruction. As an example, a memory-to-accumulator move can be implemented with a LDN (load via N) instruction, which can take on one of sixteen opcodes, one for each of the sixteen scratchpad registers. In addition to indirect addressing, three other addressing modes are provided — direct addressing for page or extended jumps, immediate addressing for data transfer from program memory to the accumulator or scratchpad registers, and register addressing for register moves or internal register control.

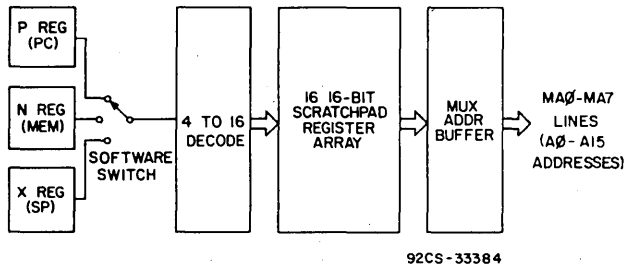

FIG. 1 — The 1800-Series CPU uses a general-register array to generate all memory addressing.

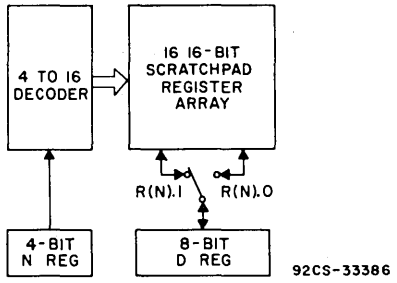

FIG. 2 — The general-register array can also be used for data storage.

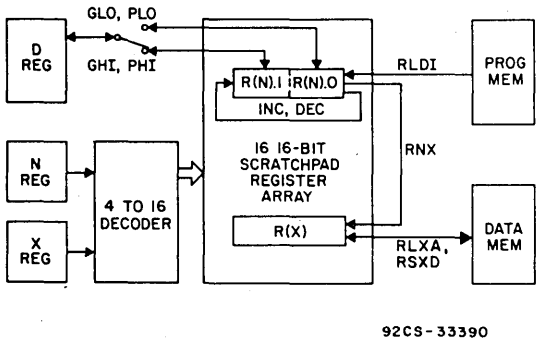

FIG. 3 — The CDP1804 microcomputer family features enhanced data manipulation with the register array.

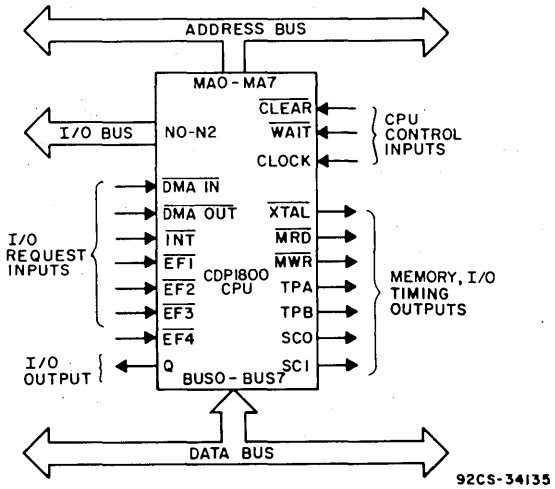

FIG. 4 — A variety of memory and I/O interface pins are available on all CDP-1800-series CPU's.

© IC MASTER 1983

External Interfacing

An 8-bit multiplexed address bus is used to generate one of 64K possible addresses to memory; a separate bi-directional bus is used for data transfer. A latch pulse, TPA, is provided to capture the high-order address byte to provide a stable address to external memory (Fig. 4): Special ROM's are available to eliminate the need for an external latch for this purpose.

The I/O structure is unique, with a separate I/O address bus, four flag inputs and one interrupt input, and a single Q-bit output port. The I/O structure allows for stack transfer directly to and from memory, while the flag and Q lines can be used as I/O pins under software control, or in serial I/O applications. In addition, DMA request inputs are provided for control of an on-board DMA counter. The DMA feature allows the CPU section to generate address and control signals for memory/I/O transfer in a continuous or cycle-stealing mode. This feature may also be used to provide a real-time clock function under hardware-update control. (Fig. 5)

Designing a System

Putting together a complete CDP-1800-based system is a straightforward task, since separate building blocks are available for each microcomputer function. A large section of this guide is devoted to details on the RAM, ROM, and I/O support components that can be used in a complete system.

A typical design (Fig. 6) can start off with a CDP1802, a ROM with built-in latches and decoding for direct interface to CDP1802 timing signals, a small RAM array for scratchpad and stack usage, and some I/O ports for interfacing to the external world. No additional memory or I/O decoders or latches are required. The 1800-series ROM has these functions on board, and can pass a chip select to an external RAM, while the ports are directly mapped in I/O space.

A higher performance level can be achieved with other devices in the line. (Fig. 7). The CDP1805, which has on-board RAM and a counter-timer, can replace and expand the discrete RAM function, while adding real-time control to the system. A larger ROM, the CDP1835, which maintains the same pinout as the CDP1833, is used here for upward compatibility. Finally, the CDP1851 replaces the two I/O ports with a 20-line expansion function, complete with handshaking and additional bidirectional and bit-programmable port-mode capability.

The Next Step

The above examples give an idea of how a system can be put together. But there is much more — complex I/O functions, serial communication, CRT control, memory latches, decoder interfaces, and other functions to suit nearly any CMOS application.

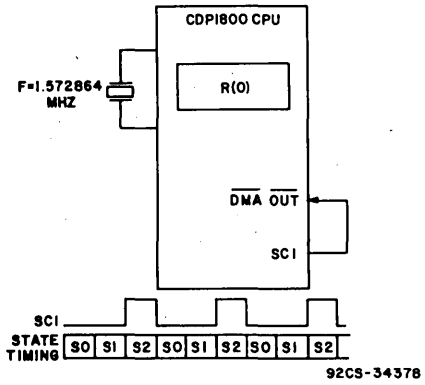

FIG. 5 — The CPU DMA feature can be used to implement a real-time clock.

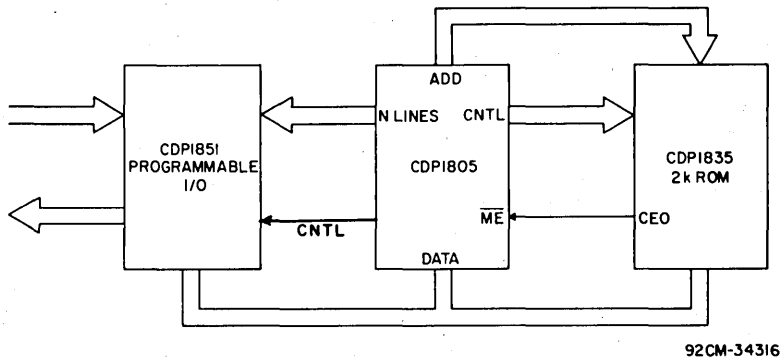

FIG. 7 — Several chip functions can be combined for a higher level of system integration and performance.

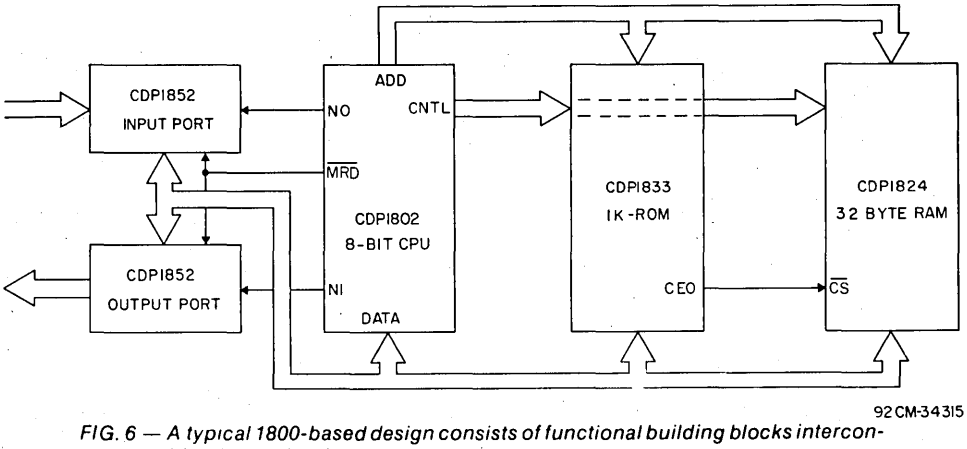

FIG. 6 — A typical 1800-based design consists of functional building blocks interconnected with minimal hardware.

Microprocessors and Microcomputers

CDP1802, CDP1802AC, CDP1802BC

The RCA-CDP1802 CMOS microprocessor is an LSI 8-bit silicon-gate CMOS register-oriented central-processing unit (CPU) designed for use as a general-purpose computing or control element in a wide variety or commercial, industrial, and military applications.

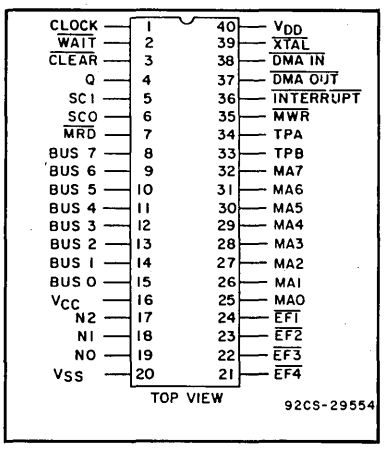
The unique architecture of the CDP1802 has been designed with a complete microcomputer system in mind so that systems with maximum flexibility and minimum cost can be realized.

The CMOS technology provides a high noise immunity to enable the CDP1802 to operate in electrically hostile environments. The CDP1802 can be powered by an unregulated power supply over a wide operating-voltage range. Further, the processor is completely static so that its system clock can be controlled to interface with slow memories or stopped to provide reduced power consumption during standby conditions.

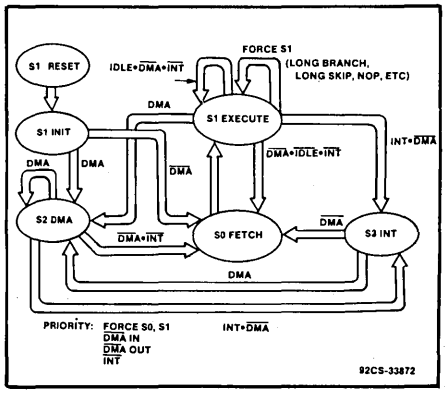
The CDP1802 provides a set of simple, easy-to-use general-purpose instructions to permit the design of programs for CDP1802-based products with minimum effort.

The CPU is available in five performance selections.

Terminal-Assignment Diagram

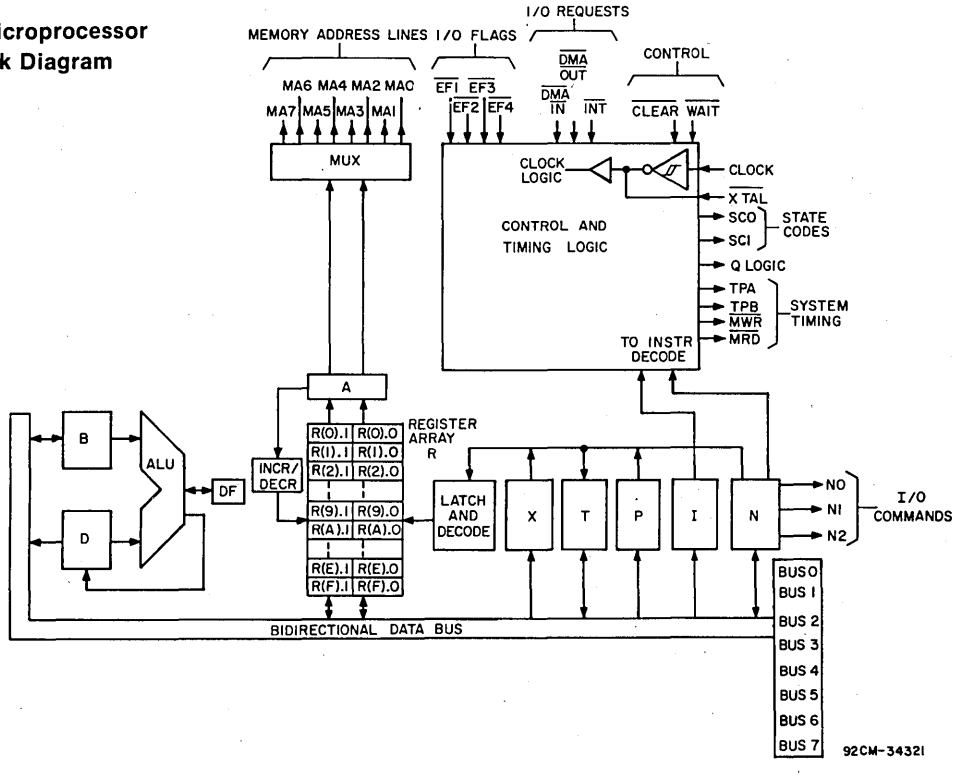


- **16 x 16 matrix of registers for use as multiple program counters, data pointers, or data registers**
- **Single-phase clock; optional on-chip crystal-controlled oscillator**
- **Flexible programmed I/O mode**
- **Four flag inputs directly tested by branch instructions**
- **Programmable single-bit output port**
- **Static circuitry — no minimum clock frequency**
- **8-bit parallel organization with bi-directional data bus and multiplexed address bus**
- **Any combination of standard RAM and ROM up to 65,536 bytes**
- **91 easy-to-use instructions**
- **On-chip DMA**
- **Program interrupt mode**

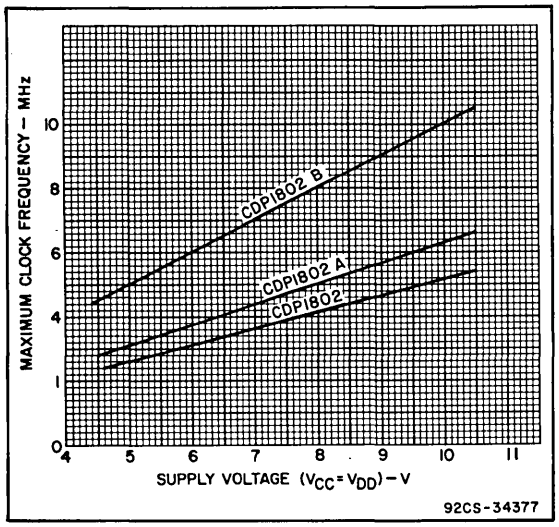


State Diagram

CDP1802 Microprocessor Family Block Diagram



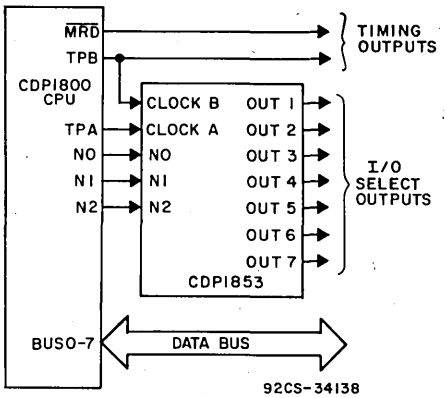
© IC MASTER 1983



CPU Selections

	Max. Clock Freq.	Operating Voltage
CDP1802C	2.5 MHz (5V)	4-6.5V
CDP1802	5.0 MHZ (10V)	4-10.5V
CDP1802AC	3.2 MHz (5V)	4-6.5V
CDP1802A	6.4 MHZ (10V)	4-10.5V
CDP1802BC	5.0 MHz (5V)	4-6.5V

I/O Address Decoding



I/O address lines (N lines) are easily decoded to provide expanded addressing in I/O space for ports and other peripheral devices.

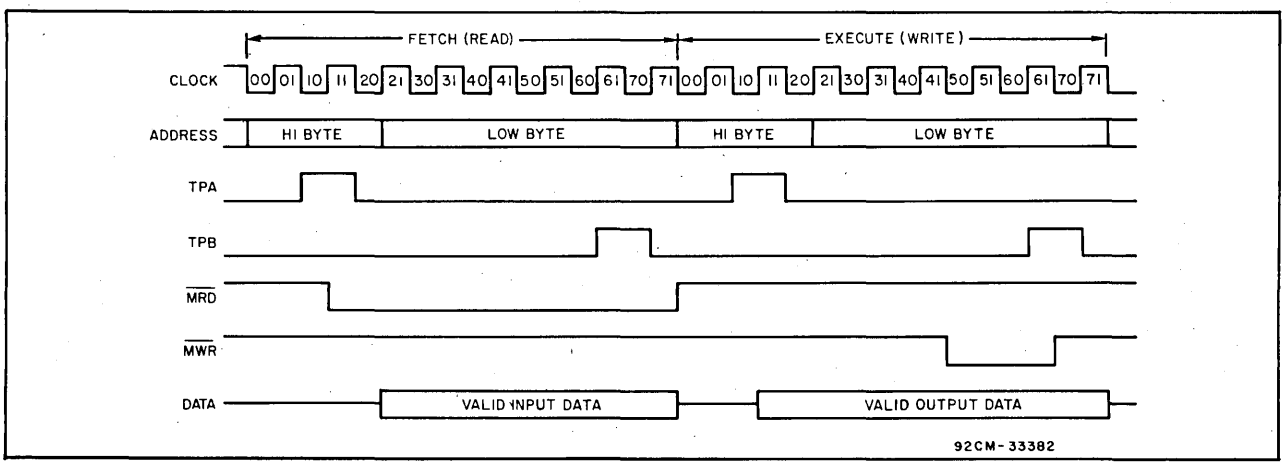
Instruction Set

The CDP1802 instruction set has a full complement of arithmetic and logic operations, conditional page and long-branch instructions that test the contents of the accumulator and carry flag, register instructions that modify the contents of the internal scratchpads or register selectors, and I/O and interrupt handling instructions.

Listed below is a breakdown of the 91 instructions common to the CDP-1802 family.

Memory Transfer	7
Internal Register	7
Logic	10
Arithmetic	12
Unconditional Jumps	4
Conditional Jumps	27
Control	7
Interrupt Control	3
I/O Transfer	14

Timing



The trailing edge of TPA is used by the memory system to latch the higher-order byte of the 16-bit memory address.

TPB is used by I/O devices to latch valid data.

$\overline{MWR}$ is the write enable signal for memory devices.

$\overline{MRD}$ is the read enable signal for memory devices and goes low during the fetch cycle.

Address Bus

In each cycle, the higher-order byte of the 16-bit address appears on the memory address lines first. Those bits required by the memory system can be strobed into external address latches by timing pulse TPA. The low-order byte of the 16-bit address appears on the address lines after the termination of TPA. Latching of all 8 higher-order address bits would permit a memory system of 64K bytes.

© IC MASTER 1983

CDP1804AC, CDP1805AC, CDP1806AC
CDP1805AC, CDP1806AC

The new 1804A μC comprises a CPU, 2k bytes of mask-programmable ROM, 64 bytes of RAM and an 8-bit timer/counter that operates in six different modes.

It's the world's first 100% static, full CMOS micro with all these functions.

Execution time is only 3.2 μs at 5MHz. The internal ROM may be deactivated for prototyping or test and debugging purposes.

In addition to program storage, the internal ROM can hold system firmware such as operating system high-level language, math routines and user-defined routines.

Our 123 powerful instructions help to make the 1804A exceptionally easy to use. Included are a full set of BCD instructions, improved call and return instructions, improved call and return instructions that minimize processing time, a 16-bit data instruction for faster data transfer, and a save instruction for improved interrupt servicing.

The CPU chip contains an array of 16-bit scratchpad registers that provide control over memory addressing and internal housekeeping. This scratchpad can be programmed indirectly through three 4-bit register designators. Memory locations are also addressed by loading address values into the scratchpad registers.

One feature that really sets the 1804A apart from competitive microcomputers is its ability to accommodate external RAM and ROM—any combination up to 64K. It includes an 8-bit multiplex address bus which can be used to generate 64K bytes of possible addresses to memory. A separate bidirectional bus is used for data transfer. A latch pulse, TPA, is provided to capture the high-order address byte to provide a stable address to external memory. Special ROMs are available to eliminate the need for an external latch for this purpose.

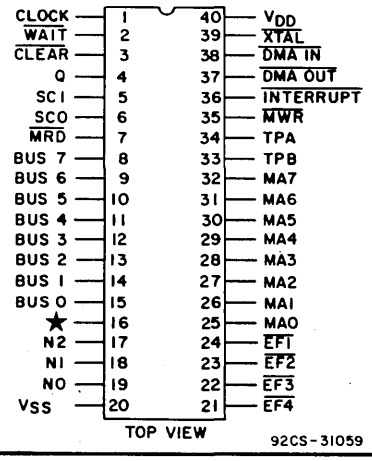
The I/O structure is unique, with a separate I/O address bus, four flag inputs, one interrupt input, and a single Q-bit output port.

The I/O structure allows for stack transfer directly to and from memory, while the flag and Q lines can be used as I/O pins under software control, or in serial I/O applications.

In addition, DMA request inputs are provided for control of an on-board DMA counter. The DMA feature allows the CPU section to generate address and control signals for memory-to-I/O transfer in a continuous or cycle-stealing mode. This feature may also be used to provide a real-time clock function under hardware-update control.

- 2k bytes of mask-programmable ROM (CDP1804A)
- 64 bytes of RAM (CDP1804A, CDP1805)
- 8-bit counter-timer operating in 6 different modes
- Enhanced interrupt controller
- Crystal- or RC- oscillator capability
- 5-MHz crystal clock (CDP1804A)
- Call-and-return instructions
- 16-bit data instruction
- 3.27-μs instruction fetch-execute time
- 123 powerful instructions (CDP1804A)
- Dual-channel event counting and pulse-width measurement
- Can address 64K bytes of external memory
- Can be used as timebase with clock source from prescaled TPA signal
- Can configure in unique modes for special functions
- Can plug into existing 1800-series sockets
- Extended temperature range: -55° C to +125° C

Terminal-Assignment Diagram



★ **Note: All terminal assignments are identical to those for the CDP1802 microprocessor family, except for terminal 16. Terminal 16 assignments for each type are shown in chart below.**

Device	Pin 16 Function

Applications

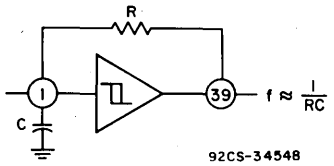
Using Internal ROM

The on-board ROM of the CDP-1804A, in addition to program storage, can hold system firmware:

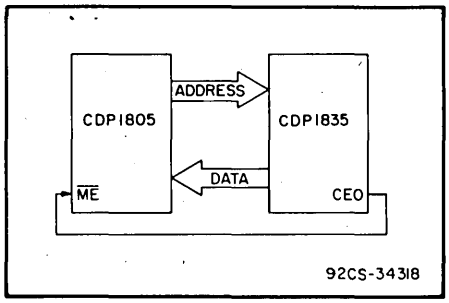
- **Operating System**
- **High-Level Language**
- **Math Routines**
- **User-Defined Routines**

Using the Clock Input

The CDP1804 family supports an RC-network configuration that can replace a crystal oscillator for clock frequencies up to 1 MHz.

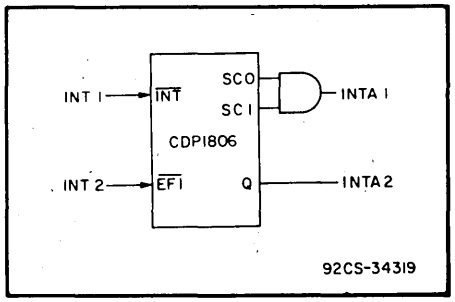


Using External ROM



Minimum 2-chip microcomputer system using CDP1805 and 2Kx8 CDP1835 ROM. This system uses the CDP1835 to address RAM, eliminating the need for external decoding.

Using the Counter-Timer



This configuration allows the CDP-1806 to have two interrupt inputs, the normal INT input of the CDP1802, and a latched, edge-sensitive interrupt created by loading the counter-timer with 01 in the event counting-mode. The Q line provides a handshake signal to the interrupting device which is reset during the service routine.

CDP1853 CDP1853C

N-Bit 1 of 8 Decoder

The RCA-CDP1853 and CDP1853C are 1 of 8 decoders designed for use in general purpose microprocessor systems. These devices, which are functionally identical, are specifically designed for use as gated N-bit decoders and interface directly with the 1800-series microprocessors without additional components. The CDP1853 has a recommended operating voltage range of 4 to 10.5 volts, and the CDP1853C has a recommended operating voltage range of 4 to 6.5 volts.

When CHIP ENABLE (CE) is high, the selected output will be true (high) from the trailing edge of CLOCK A (high-to-low transition) to the trailing edge of CLOCK B (high-to-low transition). All outputs will be low when the device is not selected (CE = 0) and during conditions of CLOCK A and CLOCK B. The CDP1853 inputs N0, N1, N2, CLOCK A, and CLOCK B are connected to an 1800 series microprocessor outputs N0, N1, TPA, and TPB respetively, when used to decode I/O commands as shown in Fig. 1. The CHIP ENABLE (CE) input provides the capability for multiple levels of decoding as shown in Fig. 2.

- **Provides direct control of up to 7 input and 7 output devices**
- **CHIP ENABLE (CE) allows easy expansion for multi-level I/O systems**

The CDP1853 can also be used as a general 1 of 8 decoder for I/O and memory system applications.

The CDP1853 and CDP1853C are supplied in hermetic 16-lead dual-in-line ceramic (D suffix) and plastic (E suffix) packages.

CDP1873C

Preliminary Data

CMOS 1 of 8 Binary Decoder

The RCA-CDP1873C is a high-speed 1 of 8 decoder designed for use with microprocessor systems that require expansion capabilities utilizing memory or input/output ports with active low chip-select inputs. The CDP1873C has a recommended operating voltage range of 4 to 6.5 volts.

When the decoder is enabled and addressed, one of its 8 outputs goes low.

Enabling is controlled by 3 chip-select inputs, allowing for easy system expansion. All outputs will be high when the decoder is not selected. The CDP1873C can be cascaded for very large systems and offers a low propagation delay that reduces memory-access time requirements in those designs where delays are critical.

The CDP1873C is supplied in hermetic 16-lead dual-in-line ceramic (D suffix) and plastic (E suffix) packages.

- *High-speed address to output enable delay 100 ns (max.) at V_{DD}=5 V*
- *Output sink 6 mA (min.) at V_{DD}=5 V*
- *I/O port or memory selector*
- *3 chip-select input allows simple expansion*

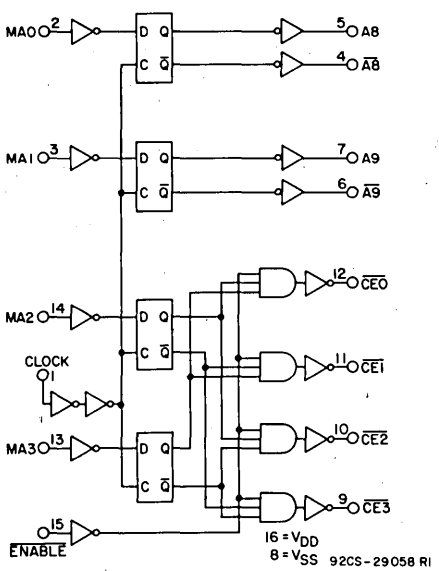
4-Bit Latch and Decoder Memory Interfaces CDP1858, CDP1859

The CDP1858, and CDP1859 are COS/MOS 4-bit latch and decoder circuits designed for use in CDP1800-series microprocessor systems. These devices are specifically designed for use as memory-system decoders and interface directly with the CDP1802 or CDP1804 family multiplexed address bus at maximum clock frequency.

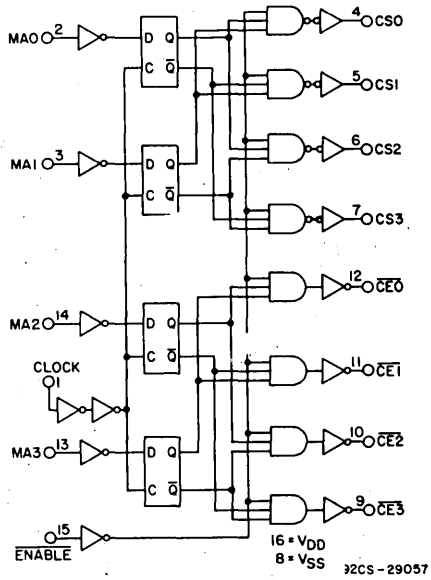
The CDP1858 interfaces the CDP-1802 or CDP1804 family address bus and up to 32 MWS5101 256x4 RAM's to provide a 4K-byte RAM system. No additional components are required.

The CDP1859 interfaces the CDP-1802 or CDP1804 family address bus and up to 32 CDP1821 1024x1 RAM's to provide a 4K-byte RAM system. The CDP1859 generates the chip selects required by the CDP1821 RAM.

CDP1858 Functional Diagram



CDP1859 Functional Diagram



- **Performs memory address latch and decoder functions multiplexed or non-multiplexed**
- **Interfaces directly with the CDP-1802 and CDP1804 families**
- **Allows decoding for systems 4096-words by 8-bits or larger**
- **Non-inverting fully buffered data transfer**

CDP1866, CDP1867, CDP1868 Types

CMOS 4-Bit Latch and Decoder Memory Interfaces

The RCA-CDP1866, CDP1867, and CDP1868 are CMOS 4-bit memory latch and decoder circuits intended for use in CDP1800 series microprocessor systems. They can interface directly with the multiplexed address bus of this system at maximum clock frequency, and up to eight 4096-bit random-access memories to provide a 4096-byte RAM system. All the necessary chip selects are provided as outputs along with additional enable inputs so that in larger memory systems, the 9-chip 4096-byte blocks can be readily accessed.

These devices are also compatible with non-multiplexed address bus microprocessors.

By connecting the clock input to V_{DD}, the latches are in the data-following mode and the decoded outputs can be used in general-purpose memory-system applications.

The CDP1866 and CDP1868 are intended for use with 1024-word RAMs and are identical except that in the CDP1868, CE1 and $\overline{CE2}$ are latched and $\overline{CS2}$ is valid on $\overline{MWR}$ only. This allows the CDP1868 to be used in a color display system with the CDP1861 and CDP1862. The CDP1867 is intended for use with 4096-word RAMs.

The CDP1866, CDP1867, and CDP1868 are supplied in an 18-lead hermetic dual-in-line ceramic package (D suffix) and an 18-lead plastic package (E suffix). The CDP1866C, CDP1867C, and the CDP1868C are available in chip form (H suffix).

- *Performs memory address latch and decoder functions multiplexed or non-multiplexed*
- *Interfaces directly with all CDP1800 family CPUs*

Byte-Wide Input/Output Port
CDP1852

The CDP1852 is an 8-bit register with logic that allows two modes of operation, input and output. In both modes, input data are strobed and latched into the register by the clock input, and a service-request output signal is available for handshaking functions.

When the mode select pin is low, the input mode is selected and the output drivers turn on when both chip selects are active, and tri-state if either one is low.

In the output mode, when the mode select pin is high, the output drivers are always on. Input data are placed in the register by the combination of the active chip selects and clock input.

- **Parallel 8-bit data latch and buffer**
- **Hand shaking via service-request signal**
- **3-state outputs**
- **Mode selectable**
- **Drives one TTL load**
- **Directly interfaces with CDP1800-series microprocessors**

CDP1856 CDP1857
CDP1856C CDP1857C

4-Bit Bus Buffers/Separators

The RCA-CDP1856, CDP1856C, CDP1857, and CDP1857C are 4-bit CMOS non-inverting bus separators designed for use in CDP1800-series microprocessor systems. They can be controlled directly by a 1800-series microprocessor without the use of additional components.

The CDP 1856 is designed for use as a bus buffer or separator between the 1800-series microprocessor data bus and memories. The CDP1857 is designed for use as a bus buffer or separator between the 1800-series microprocessor data bus and I/O devices. Both types provide a chip-select (CS) input signal which, when high (1), enables the bus-separator three-state output drivers. The direction of data flow, when enabled, is controlled by the MRD input signal.

The CDP1856 or CDP1857 can be used as a bi-directional bus buffer by connecting the corresponding DI and DO terminals (Fig. 2). The $\overline{MRD}$ output signal from the 1800 series microprocessor has the correct polarity to control the CDP1856 when this device is used as a memory data bus buffer/ separator, or the CDP1857 when it is used as I/O bus buffer/separator. Therefore, the 1800 series microprocessor $\overline{MRD}$ signal can be connected directly to the $\overline{MRD}$ input of either device.

The CDP1856 and CDP1857 are functionally identical to the CDP1856C and CDP1857C, respectively. The CDP1856 and CDP1857 have a recommended operating-voltage range of 4 to 10.5 volts, and the CDP1856C and CDP1857C have a recommended operating-voltage range of 4 to 6.5 volts. The CDP1856, CDP1856C, CDP1857 and CDP1857C are supplied in 16-lead hermetic, dual-in-line ceramic packages (D suffix), and in 16-lead plastic packages (E suffix).

- *Provides easy connection of memory and I/O devices to CDP1800-series microprocessor data bus.*
- *Non-inverting fully buffered data transfer*

Preliminary Data

CDP1872C, CDP1874C, CDP1875C

High-Speed 8-Bit Input and Output Ports

The RCA-CDP1872C, CDP1874C and CDP1875C devices are high-speed 8-bit parallel input and output ports designed for use in the CDP1800 microprocessor system and for general use in other microprocessor systems. The CDP1872C and CDP1874C are 8-bit input ports; the CDP1875C is an 8-bit output port.

These devices have flexible capabilities as buffers and data latches and are reset by $\overline{CLR}$ input when the data strobe is not active.

The CDP1872C and CDP1874C are functionally identical except for device selects. The CDP1872C has one active low and one active high select; the CDP1874C has two active high device selects. These devices also feature 3-state outputs when deselected. Data is strobed into the register on the leading edge of the CLOCK and latched on the trailing edge of the CLOCK.

The CDP1875C is an output port with data latched into the registers when the device selects are active. There are two active high and one active low selects. The output buffers are enabled at all times.

These devices are supplied in 22-lead hermetic, dual-in-line side-brazed ceramic packages (D suffix) and in 22-lead dual-in-line plastic packages (E suffix).

- *Parallel 8-bit input/output register with buffered outputs*
- *High-speed data-in to data-out: 85 ns (max.) at V_{DD}=5 V*
- *Flexible applications in microprocessor systems as buffers and latches*
- *High order address-latch capability in CDP1800 series microprocessor systems*
- *Output sink current=5 mA (min.) at V_{DD}=5 V*
- *3-state output-CDP1872C and CDP1874C*

Programmable I/O Interface
CDP1851

The CDP1851 is a general-purpose, software-programmable I/O device that has 20 I/O lines that may be used in several different modes of operation. Two full 8-bit ports, complete with handshaking lines, are provided for efficient interfacing between a parallel CPU bus and peripheral functions. The CDP1851 is programmed by the CPU, by means of its control register, to define port mode, interrupt enabling, I/O bit assignment, and bit-masking.

- **General-purpose programmable I/O device that has 20 I/O lines that may be used in several different modes of operation**
- **Four software-controlled modes of operation: input, output, bidirectional, and bit-programmable**
- **Interfaces without additional components to all 1800-series microprocessors, in I/O or memory space**

Terminal-Assignment Diagram

Programmable UART's
CDP1854A, CDP6402

The CDP1854A and the CDP6402 are CMOS/LSI Universal Asynchronous Receiver/Transmitters (UART's) for interfacing computers or microprocessors to asynchronous serial data channels. The receiver converts serial start, data, parity, and stop bits to parallel data verifying proper code transmission, parity, and stop bits. The transmitter converts parallel data into serial form and automatically adds start, parity, and stop bits.

The data word length can be 5, 6, 7, or 8 bits. Parity may be odd or even. Parity checking and generation can be inhibited. Stop bits can be 1, 1½, or 2 bits.

- **Programmable word length, stop bits, and parity**
- **Baud rate to 250K bits/sec. at 5V (500K at 10V)**
- **Two operating modes (CDP1854A) selected by pin 2**
  Mode 0 — (pin 2 grounded) — hardware - programmable word length, stop bits, and parity
  Mode 1 — (pin 2 at VDD) — interfaces directly to 1800-series microprocessors without additional components; software-selectable word length, stop bits, and parity
- **CDP6402 industry standard pinout (pin 2, no connection). Direct replacement for IM6402 and HD6402**
- **Single, noncritical voltage supply**

Multiply/Divide Unit (MDU)

CDP1855

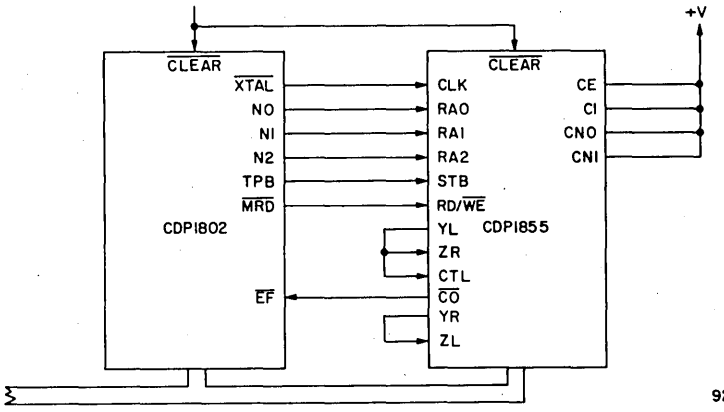
The CDP1855 is an efficient hardware replacement for the software only implementation of arithmetic and signal-processing algorithms. It performs multiply and divide operations on unsigned 8-bit data with an add-and-shift type of hardware implementation and is structured to permit cascading of identical units to handle operations up to 32 bits.

The MDU has three 8-bit registers, X, Y, and Z, which are loaded by the CPU with operands prior to the arithmetic operation and which contain a product or quotient when the process is complete.

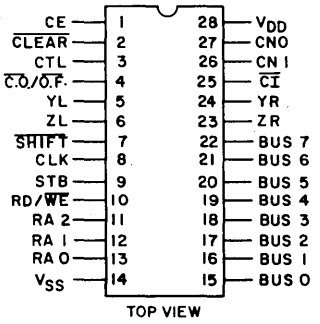
The CDP1855 can be used in any application that requires fast multiply or divide throughput, or where the CPU would be required to perform real-time tasks during a long arithmetic routine. MDU efficiency increases as word size increases.

Word Size	Approximate Number of Machine Cycles	
	Software Algorithm	Hardware (MDU)
8x8, or 16÷8	280	26
16x16, or 32÷16	1000	41
32x32, or 64÷32	5000	89

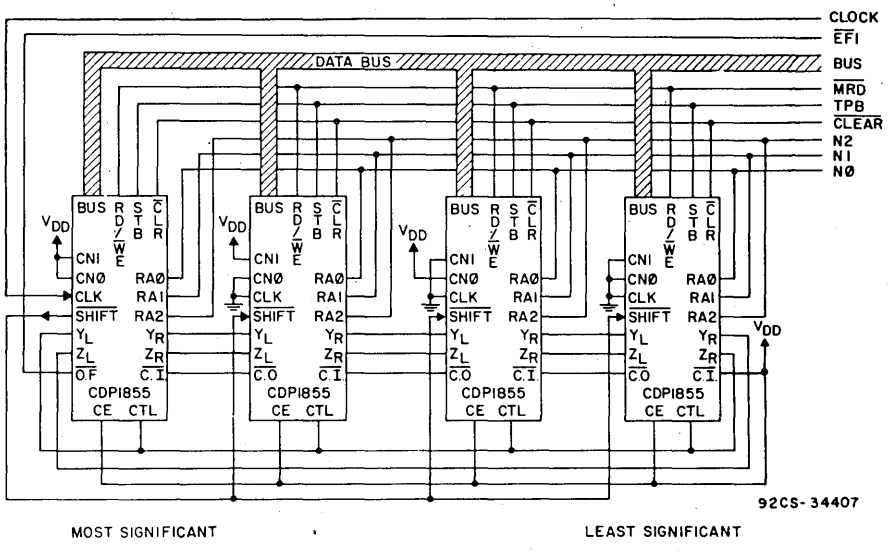
Circuit Configuration for a Single MDU Addressed in I/O Space.



Terminal-Assignment Diagram



Cascaded CDP1855 Configuration.



- **Significantly reduces throughput time of microcomputer systems used for arithmetic calculations**
- **Directly interfaces with 1800-series microprocessors without additional components**
- **Performs the actual hardware 8x8 bit multiply or 16÷8 divide in 5usec, with additional software overhead for I/O of data**
- **Cascadable up to 4 units for 32x3 bit multiply or 64÷32 divide**

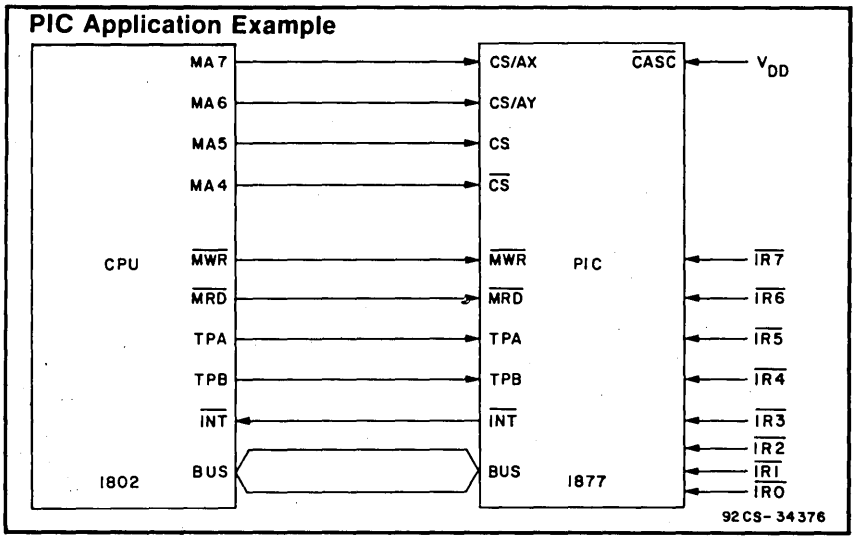
© IC MASTER 1983

Programmable Interrupt Controller (PIC)
CDP1877

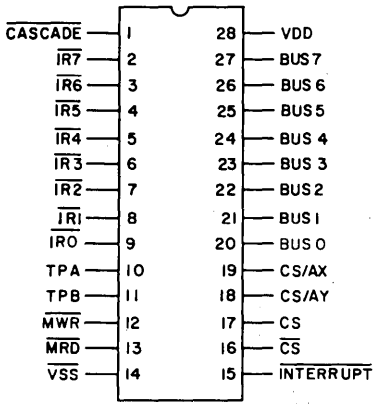
The CDP1877 is a programmable 8-level interrupt controller designed for use in CDP1800-series microprocessor systems. It provides added versatility by extending the number of permissible interrupts from 1 to N in increments of 8.

- **Memory mapped**
- **Programmable long-branch vector address and vector interval**
- **Eight levels of interrupt per chip**
- **Easily expandable**
- **Latched interrupt requests**
- **Hard-wired interrupt priorities**
- **Multiple chip-select inputs to minimize address-space requirements**

PIC Application Example



Terminal-Assignment Diagram



Programming Instructions for PIC

1. Disable INTERRUPT at CPU.
2. Reset Master Interrupt Bit, B3, of Control Register.
3. Write a "1" into the interrupt input bit location of the mask register if masking is desired.
4. Write the High-Order Address byte into the page register.
5. Write the Low-Order Address and the Vector Interval into the control register.
6. Program R(1) of the CPU to point to the PIC so that the Long-Branch Instruction can be read from the PIC during the Interrupt Service Routine.

Programming Model

Page Register — WRITE ONLY

BUS 7							BUS 0
A15	A14	A13	A12	A11	A10	A9	A8

Contains the high-order vector address the device issues in response to an interrupt.

Control Register — WRITE ONLY

BUS 7							BUS 0
B7	B6	B5	B4	B3	B2	B1	B0

Under nibble contains the low-order vector address the device will issue in response to an interrupt. Lower nibble is used for master mask reset, interrupt reset, and interval select.

Mask Register — WRITE ONLY

BUS 7							BUS 0
M7	M6	M5	M4	M3	M2	M1	M0

A "1" written into any location in this register will mask the corresponding interrupt request line.

Status Register — READ ONLY

BUS 7							BUS 0
S7	S6	S5	S4	S3	S2	S1	S0

A "1" will be present in the corresponding bit location for every pending interrupt.

Polling Register — READ ONLY

BUS 7							BUS 0
P7	P6	P5	P4	P3	P2	P1	P0

Provides the low-order vector address and is used to identify the source of interrupt if a polling technique is used.

CDP1877 Programming Procedure

Several PIC's can be cascaded together by connecting the interrupt output of one chip to the cascade input of another. Each cascaded PIC provides 8 additional interrupt levels to the system.

Interrupts are prioritized in descending order; IR7 has the highest, and IR0 has the lowest priority.

© IC MASTER 1983

Dual Counter-Timer
CDP1878

The CDP1878 is a versatile 28-pin device that consists of two 16-bit programmable down counters that function independently in one of five possible modes. There are three address pins to select the counters or separate control and status registers. Each counter has complemented outputs that are activated as the operating mode requires, and a common maskable interrupt output is available for handshaking functions.

In operation, a user jams a desired counter value in two 8-bit sequences and then selects the desired mode and intiates timing by writing to the control register. This control register, which programs gate-level and interrupt enabling, can also be used to stop the counter at any time and can assure a stable counter readout by freezing the present count into a separate holding register.

The five counter modes, together with different combinations of gating levels, output polarity, and underflow interrupt indication, provide a complete array of timing, pulse-forming, and event-counting programming, as shown in the "Modes of Operation" chart.

CDP1878 Counter-Timer — Modes of Operation

Name	Function	Application
Timeout	Outputs change when clock decrements counter to zero	Event counter
Timeout strobe	One clock-wide output pulse when clock decrements counter to zero	Trigger pulse
Gate controlled one-shot	Outputs change when clock decrements counter to zero, Retriggerable	Time-delay generation
Rate generator	Repetitive clockwide output pulse	Timebase generator
Variable duty cycle	Repetitive output with Programmed duty cycle	Motor control

Real Time Clock
CDP1879

The CDP1879 real-time clock consists of five programmable counters that divide down an oscillator input to supply time and calendar information in BCD from seconds to months. The device operates with several different crystal frequencies and has a separate clock output that can supply subsecond to day square-wave outputs along with an interrupt request.

The CDP1879 includes an alarm circuit that can be set for seconds, minutes, or hours and that activates the interrupt output when the alarm registers match those of the counters. A status register keeps track of alarm and clock status when interrupts are disabled.

The power-down input pin, used in conjunction with the alarm circuit and interrupt output, can be used as a "wake-up" control for low-power applications.

Clock rollover (when the seconds counter is clocked during counter reads, resulting in additional software overhead to check this condition) is eliminated with a transparent "freeze" circuit that guarantees stable and accurate readouts.

- **Time-of-day/calendar reads seconds, minutes, hours, day of month, and month**
- **Seconds, minutes, and hours alarm circuitry**
- **General-purpose and CDP1800-Series microprocessor compatibility**
- **1-of-4 crystal frequency operation — 32768 Hz, 1.04 MHz, 2.09 MHz, 4.194 MHz**
- **Interrupt output activated by clock output or alarm circuit**
- **Separate clock output selects 1 of 15 50% duty cycle output signals**
- **Power-down mode**
- **Transparent "freeze" circuit eliminates clock rollover during reads**

CDP1869, CDP1870, CDP1876

RCA Solid State

The CDP1869 and CDP1870 or CDP1876 form a two-chip Video Interface System used to control the screen formatting, screen-refresh memory, and synchronization of a raster-scan color display. The CDP-1869 handles the system interface with the CPU and provides the refresh memory address timing. A tone and white-noise output, programmable in both frequency and amplitude, is also available. The CDP1870 or CDP1876 handles the TV synchronization and color subcarrier information. The dot (LUM), color (CHROM) and sync (COMPSYNC) signals are all produced on-board and externally combined into a single signal for use with a standard color monitor. The CDP-1876 is a bond-out option of the CDP-1870 for use with RGB monitors.

- **PAL and NTSC compatible**
- **Page memory is accessed as extension of CPU memory during non-display time**
- **Hardware scroll capability**
- **Audio generator (576 selectable tones covering 8 octaves) and white noise generator. Both tones and white noise can be enveloped from 0 volts to 0.78 V_{DD} in 16 steps**
- **6x8 or 6x16 char. matrix (6x9 for PAL)**
- **Low chip-count systems for games and/or "intelligent" terminals**
- **Programmable for 12/24 rows, 20/40 char/rows**
- **Graphics and motion through character selection or bit map in character memory**
- **Character memory may be any combination of ROM or RAM, allowing modification of characters and graphics**
- **CPU not involved in screen refresh**
- **Composite sync, composite luminance, and composite chrominance outputs**
- **Programmable background color**
- **Programmable color format control allowing several modes for high resolution color**
- **External horizontal and vertical sync inputs allow for integration into existing chassis for character-on-picture overlays**
- **Character generation approach minimizes memory**
- **Non-interlaced**
- **RGB bond-option available (CDP-1876)**

Keyboard Encoder
CDP1871A

The CDP1871A keyboard encoder is used to scan up to 53 ACSII-coded keys and 32 hex-coded keys. The keyboard may be made up of simple single-pole-single-throw (SPST) mechanical switches. Alpha-lock, shift, and control inputs are provided, as is an external R-C debounce input. The N-key lockout features prevents unwanted key codes if more than one key is pressed.

CDP1863, CDP1863C

Preliminary Data

CMOS 8-Bit Programmable Frequency Generator

The RCA-CDP1863 and CDP1863C CMOS integrated circuits are programmable frequency generators designed to produce 256 possible frequencies from a single-frequency input clock. They will interface directly with the CDP1800-series microprocessor as shown in the system diagram (see Fig. 1).

The CDP1863 and CDP1863C consist of a programmable up-counter and an 8-bit latch (see Fig. 2). An input clock is predivided by a fixed internal counter chain in addition to the programmable counter. The final stage of the device divides the output of the up-counter by two to provide a square-wave output. The input clock may be applied to either of two inputs; CLK1 provides a divide-by-four predivide, and CLK2 a divide-by-eight. The unused input must be tied to V_{DD} to avoid interference with the true clock. After the programmable up-counter has reached its maximum count, the next predivided clock pulse will cause it to go to zero. At this time, the output flip-flop toggles and the load flip-flop is turned on. The output of the load flip-flop is fed into the NOR gates which allow the divide rate stored in the 8-bit latch to preset the up-counter. Before the next predivided clock pulse clocks this up-counter, the load flip-flop is reset and the NOR gates are turned off. The counter then resumes its up-count. The data at the eight data inputs is latched into the device by the high-to-low transition of CLK1, when STR(STROBE) is high, or by the high-to-low transition of STR, when CLK1 is high.

When using CLK2, CLK1 must be tied to V_{DD} to permit the STR input to generate the internal latch clock. The 8-bit data in the latch determines the divide rate of the programmable up-counter in the device. This rate may range from divide-by-one to divide-by-256.

A low level on the $\overline{\text{RESET}}$ input resets the up-counter, predividers, and flip-flops, and forces an initial state into the 8-bit data latch. This initial state provides a fixed divide rate for the device prior to running the system. A high level on the $\overline{\text{RESET}}$ input enables the up-counter, predividers, and flip-flops and allows programming a new divide rate into the device.

The CDP1863 and CDP1863C are functionally identical. They differ in that the CDP1863 has an operating voltage range of 4 to 10.5 volts and the CDP1863C has an operating voltage range of 4 to 6.5 volts. Both are supplied in 16-lead hermetic dual-in-line ceramic packages (D suffix) and in 16-lead dual-in-line plastic packages (E suffix).

CDP1861C, CDP1862C, CDP1864C

Video-Display Controllers

The CDP1861C is low-resolution video controller designed for sample graphics displays. It uses a combination of interrupt and DMA techniques for screen refreshing. The CDP1862C is used with the CDP1861C to add programmable color capability to a system.

The CDP1864C is a combination of the CDP1861C and CDP1862C, but for use with the European PAL TV standard.

- **Supports bit-mapped video display for graphic flexibility**
- **Generates composite horizontal and vertical sync**
- **Programmable background color**
- **Programmable vertical resolution for matrix display**
- **Real-time interrupt generator**
- **Programmable video (dot) color**
- **On-chip crystal controlled oscillator**
- **Interlaced or non-interlaced displays**
- **NTSC compatible color and RGB compatible**
- **Single chip contains circuitry for video, sync, RBG color, and programmable frequency for tone generation**
- **Programmable 1-of-8 dot colors plus 1-of-4 background colors**
- **Bit-mapped display with maximum resolution of 192 vertical x 64 horizontal**

The CMOS 6805 Family

The 8-bit CMOS micro market is starting to grow at an explosive rate. Because no single line of CMOS micros can cover every application, RCA decided to alternate source a popular single-chip microcomputer series. Therefore, RCA entered into a technical exchange agreement with Motorola to alternate source the 6805 series of micros. This comprehensive agreement includes provisions for the exchange of masks.

An important reason for choosing the CMOS 6805 to supplement the RCA 1800 series is that the CMOS 6805 is based on the powerful and versatile 6805 architecture, a proven industry standard with familiar instruction sets. We were impressed with Motorola's thoughtful and orderly approach to the 8-bit CMOS μC. And the baseline process technology was compatible with RCA's existing CMOS μP technology.

The technical leadership of RCA and Motorola in CMOS microprocessors will make the CMOS 6805 series a great success in the marketplace.

A powerful microcomputer.

The CDP6805 series consists of static CMOS single-chip devices.

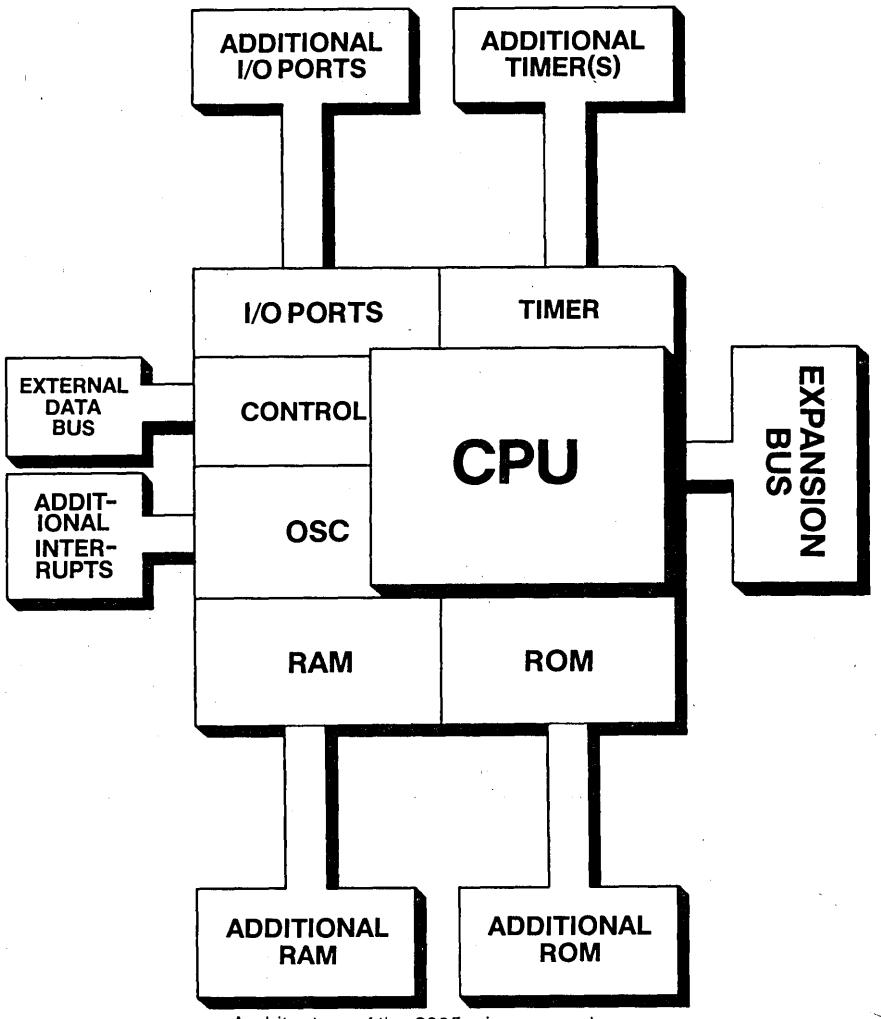
Each micro has a 3 to 8V operating voltage range, with "wait" and "stop" instructions that save power in standby modes.

The instruction set is optimized for controller applications, where the bit handling instruction, indexed addressing, and memory mapped I/O are effective. The 8-bit timer-counter has a programmable prescaler.

The micros in the family have 61 basic instruction types and 209 total instructions that execute in an average of less than 4.05 μs each at 1MHz.

Industry standard architecture.

The features of the various CMOS 6805 micros are described in the chart below.



Architecture of the 6805 microcomputer.

But there's one very important point they have in common: They're all based on the powerful and versatile 6805 architecture, a proven industry standard. This means you get compatibility with other 6800-based programs and devices and easier product conversion into CMOS systems.

The easy-to-program architecture even allows complete program access to the RAM and ROM memory spaces.

Peripheral devices, too.

In addition to the microcomputers, we'll be offering a full line of peripheral devices.

The first devices to be made available are the CDP65516 2KX8 CMOS ROM; the CDP6818 CMOS real-time clock I/O with 50 bytes of user RAM, programmable period interrupts and square wave generator; and the CDP6823 parallel interface with 24 individually programmable bi-directional ports.

With these peripherals, and the new devices we're developing right now, you'll be ready to put the power and economy of the CDP6805 CMOS family to work for you immediately.

Device	Description	Availability
CDP6805E2	112 bytes RAM, 16 I/O ports	1Q'83, Warehouse stock
CDP6805F2	1K ROM, 64 bytes RAM, 20 I/O ports	4Q'82, Acceptance of ROM patterns
CDP6805G2	2K ROM, 112 bytes RAM, 32 I/O ports	4Q'82, Acceptance of ROM patterns
CDP65516	2KX8 MUX ROM	4Q'82, Acceptance of ROM patterns
CDP6818	Real-Time Clock I/O	1Q'83, Warehouse stock

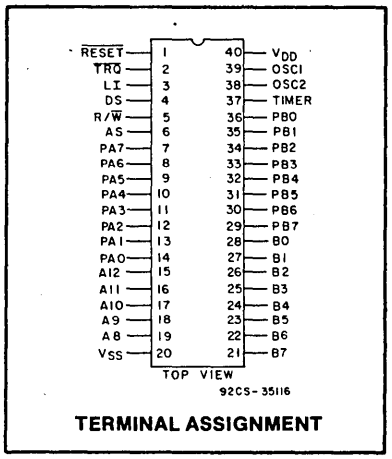
CDP6805E2

Objective Data

CMOS 8-Bit Microprocessor

The CDP6805E2 Microprocessor Unit (MPU) belongs to the CDP6805 Family of Microcomputers. This 8-bit fully static and expandable microprocessor contains a CPU, on-chip RAM, I/O, and TIMER. It is a low-power, low-cost processor designed for low-end to mid-range applications in the consumer, automotive, industrial, and communications markets where very low power consumption constitutes an important factor. The following are the major features of the CDP6805E2 MPU.



TERMINAL ASSIGNMENT

Hardware Features

- *Typical full speed operating power of 35 mW @ 5 V*
- *Typical WAIT mode power of 5 mW*
- *Typical STOP mode power of 25 µW*
- *112 bytes of on-chip RAM*
- *16 bidirectional I/O lines*
- *Internal 8-bit timer with software programmable 7-bit prescaler*
- *External timer input*
- *Full external and timer interrupts*
- *Multiplexed address/data bus*
- *Master reset and power-on reset*
- *Capable of addressing up to 8K bytes of external memory*
- *Single 3- to 6-volt supply*
- *On-chip oscillator*
- *40-pin dual-in-line package*

Software Features

- *Similar to the MC6800*
- *Efficient use of program space*
- *Versatile interrupt handling*
- *True bit manipulation*
- *Addressing modes with indexed addressing for tables*
- *Efficient instruction set*
- *Memory mapped I/O*
- *Two power saving standby modes*

Objective Data

CDP6805F2
CMOS High-Performance Silicon-Gate 8-Bit Microcomputer

The CDP6805F2 Microcomputer Unit (MCU) belongs to the CDP6805 Family of Microcomputers. This 8-bit MCU contains on-chip oscillator CPU, RAM, ROM, I/O, and Timer. The fully static design allows operation at frequencies down to DC, further reducing its already low-power consumption. It is a low-power processor designed for low-end to mid-range applications in the consumer, automotive, industrial, and communications markets where very low power consumption constitutes an important factor.

- *Typical full speed operating power of 10 mW at 5 V*
- *Typical WAIT mode power of 3 mW*
- *Typical STOP mode power of 25 µW*
- *Fully static operation*
- *64 bytes of on-chip RAM*
- *1089 bytes of on-chip ROM*
- *16 bidirectional I/O lines*
- *4 input-only lines*
- *Internal 8-bit timer with software programmable 7-bit prescaler*
- *External timer input*
- *External and timer interrupts*
- *Self-check mode*
- *Master reset and power-on reset*
- *Single 3 to 6 volt supply*
- *On-chip oscillator*
- *1 µs cycle time*
- *28-pin dual-in-line package*

Software Features:

- *Similar to the MC6800*
- *Efficient use of program space*
- *Versatile interrupt handling*
- *True bit manipulation*
- *Addressing modes with indexed addressing for tables*
- *Efficient instruction set*
- *Memory-mapped I/O*
- *User-callable self-check routines*
- *Two power-saving standby modes*

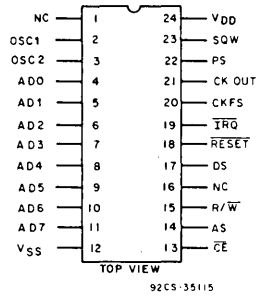
CDP6818

Objective Data

CMOS Real-Time Clock with RAM

The CDP6818 Real-Time Clock plus RAM is a peripheral device which includes the unique MOTEL concept for use with various microprocessor, microcomputers, and larger computers. This part combines three unique features: a complete time-of-day clock with alarm and one hundred year calendar, a programmable periodic interrupt and square-wave generator, and 50 bytes of low-power static RAM. The CDP6818 uses high-speed CMOS technology to interface with 1 MHz processor buses, while consuming very little power.

The Real-Time Clock plus RAM has two distinct uses. First, it is designed as a battery powered CMOS part (in an otherwise NMOS/TTL system) including all the common battery backed-up functions such as RAM, time, and calendar. Secondly, the CDP6818 may be used with a CMOS microprocessor to relieve the software of the timekeeping workload and to extend the available RAM of an MPU such as the CDP6805E2.



TERMINAL ASSIGNMENT

- Low-Power, High-Speed, High-Density CMOS
- Internal Time Base and Oscillator
- Counts Seconds, Minutes, and Hours of the Day
- Counts Days of the Week, Date, Month, and Year
- 3 V to 6 V Operation
- Time Base Input Options: 4.194304 MHz, 1.048576 MHz, or 32.768 kHz
- Time Base Oscillator for Parallel Resonant Crystals
- 40 to 200 μW Typical Operating Power at Low Frequency Time Base
- 4.0 to 20 mW Typical Operating Power at High Frequency Time Base
- Binary or BCD Representation of Time, Calendar, and Alarm
- 12- or 24-Hour Clock with AM and PM in 12-Hour Mode
- Daylight Savings Time Option
- Automatic End of Month Recognition
- Automatic Leap Year Compensation

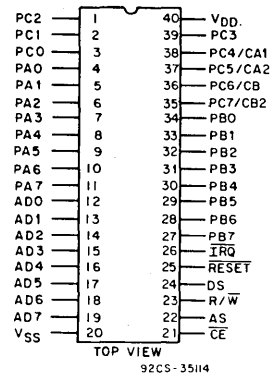
CDP6823

Objective Data

CMOS Parallel Interface

The CMOS CDP6823 Parallel Interface (PI) provides a universal means of interfacing external signals with the CDP6805E2 CMOS microprocessor, and other multiplexed bus microprocessors. The unique MOTEL circuit on-chip allows direct interfacing to most industry CMOS microprocessors, as well as many NMOS MPUs.

The CDP6823 PI includes three bidirectional 8-bit ports, or 24 I/O pins. Each I/O line may be separately established as an input or an output under program control via data direction registers associated with each port. Using the bit change and test instructions of the CDP6805E2, each individual I/O pin can be separately accessed. All port registers are read/write bytes to accommodate read/modify/write instructions.



TERMINAL ASSIGNMENT

- 24 Individual Programmed I/O Pins
- MOTEL Circuit for Bus Compatibility with Many Microprocessors
- Multiplexed Bus Compatible with: CDP6805E2 and Competitive Microprocessors
- Data Direction Registers for Ports A, B, and C
- Port C may also be Control Lines for:
  - Four Interrupt Inputs
  - Input Byte Latch
  - Output Pulse
- 16 Registers Addressed as Memory Locations
- Handshake Control Logic for Input and Output Peripheral Operation
- Interrupt Output Pin
- Reset Input to Clear Interrupts and Initialize Internal Registers
- 40-Pin Package

© IC MASTER 1983

8001
EDLC™ ETHERNET DATA LINK CONTROLLER

PRELIMINARY DATA SHEET

NOVEMBER 1982

Features

- 100% Ethernet Compatible
- 10 MHz Serial/Parallel Conversion
- Preamble Generation and Removal
- Automatic 32-Bit FCS (CRC) Generation and Checking
- Collision Handling, Transmission Deferral and Retransmission with Automatic Jam and Backoff Functions
- Error Interrupt and Status Generation
- 40 Pin Package
- Single 5V ±5% Power Supply
- Standard CPU and Peripheral Interface Control Signals
- Loopback Capability for Diagnostics
- Single Phase Clock
- All Inputs and Outputs TTL Compatible

Description

The SEEQ Ethernet Data Link Controller (EDLC) is designed to support the Data Link Layer (layer 2) of the Ethernet specification for Local Area Networks (LAN). The protocol used is Carrier Sense Multiple Access with Collision Detection (CSMA/CD). The 8001 EDLC chip is a single 40 pin VLSI device which replaces approximately 60 MSI and SSI devices. It is designed to greatly simplify the development of Ethernet communication in computer based systems. The 8001 provides an economic solution for the construction of an Ethernet node, providing high speed data communication at 10 Megabits/second and sees applications in terminals, workstations, personal computers, small business systems, and large computer systems, in both the office and industrial environment. The 8001 EDLC chip has a universal system interface which will interface with almost any microprocessor, microcomputer, or system bus with equal ease, allowing the system designer to make the price performance tradeoffs for each application. The transmit and receive sections of the EDLC chip are independent and can operate simultaneously to allow reception of a transmitted frame for use in loopback diagnostics modes.

Functional Block Diagram

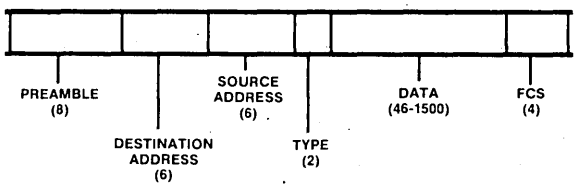
Functional Description

Frame Format

On an Ethernet communication network, information is transmitted and received in packets or frames. An Ethernet frame consists of a preamble, two address fields, a type field, a data field, and a frame check sequence. Each field has a specific format which is described in detail below. An Ethernet frame has a minimum length of 64 bytes and a maximum length of 1518 bytes exclusive of the preamble. The Ethernet frame format is shown below.



NOTE:
Field length in bytes in (parens).

Preamble: *The preamble is a 64 bit field consisting of 62 alternating "1"s and "0"s followed by a "11" End-of-Preamble indicator.*

Destination Address: *The Destination Address is a 6 byte field containing either a specific Station Address, a Broadcast Address, or a Multicast Address to which this frame is directed.*

Source Address: *The Source Address is a 6 byte field containing the specific Station Address from which this frame originated.*

Type Field: *The Type Field consists of two bytes. This field is uninterpreted at the Data Link Layer, and is passed through the EDLC chip to be handled at the Client Layer.*

Data Field: *The Data Field consists of 46 to 1500 bytes of information which are fully transparent in the sense that any arbitrary sequence of bytes may occur.*

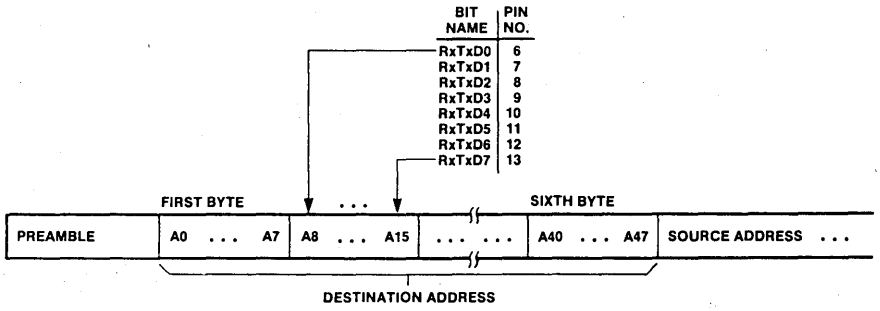
Frame Check Sequence: *The Frame Check Sequence field is a 32-bit cyclic redundancy check (CRC) value computed as a function of the Destination Address Field, Source Address Field, Type Field, and Data Field. The FCS is appended to each transmitted frame, and used at reception to determine if the received frame is valid.*

Transmitting

The transmit data stream consists of the Preamble, four information fields, and the FCS which is computed in real time by the EDLC and automatically appended to the frame at the end of the serial data. The preamble is also generated by the EDLC chip and transmitted immediately prior to the Destination Address. Destination Address, Source Address, Type Field and Data Field are prepared in the buffer memory prior to initiating transmission. The EDLC chip encapsulates these fields into an Ethernet frame by inserting a preamble prior to these information fields and appending a CRC after the information fields.

Transmission Initiation/Deferral

The Ethernet node initiates a transmission by storing the entire information content of the frame to be transmitted in an external buffer memory, and then transferring initial frame bytes to the EDLC chip Transmit FIFO. "Transmit-buffer to FIFO" transfers are coordinated via the $\overline{TxWR}$ and TxRDY handshake interface, i.e., bytes are written to the FIFO via $\overline{TxWR}$ only when TxRDY is HIGH. Actual transmission of the data onto the network will only occur if the network has not been busy for the minimum defer time (9.6 μsec) and any Backoff time requirements have been satisfied. When transmission begins, the EDLC chip activates the transmit enable (TxEN) line concurrently with the transmission of the first bit of the preamble and keeps it active for the duration of the transmission.



BITS WITHIN A BYTE ARE TRANSMITTED/RECEIVED
BIT NO. "0" FIRST THROUGH BIT NO. "7" LAST.

Figure 1. Bit Serialization/Deserialization

© IC MASTER 1983

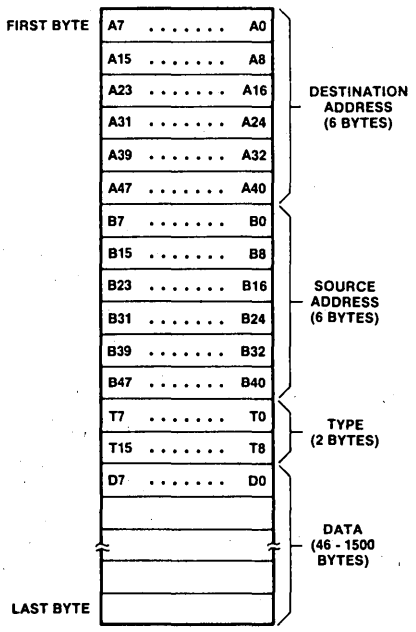


Figure 2. Typical Frame Buffer Format for Byte-Organized Memory

Collision

When concurrent transmissions from two or more Ethernet nodes occur, (collision), the EDLC chip halts the transmission of the data bytes in the Transmit FIFO and transmits a Jam pattern consisting of 55555555 Hex. At the end of the Jam transmission, the EDLC chip issues a TxRET signal to the CPU, and begins the Backoff wait period.

To reinitiate transmission, the initial bytes of the frame information fields must be reloaded into the EDLC chip transmit FIFO. The RxRET is used to indicate to the Buffer Manager the need for frame reinitialization. The reloading of the Transmit FIFO may be done prior to the Backoff interval elapsing, so that no additional delay need be incurred to retransmission.

Scheduling of retransmission is determined by a controlled randomization process called Truncated Binary Exponential Backoff. The EDLC chip waits a random interval between 0 and 2^K slot times (51.2 μsec per slot time) before attempting retransmission, where "K" is the current transmission attempt number (not to exceed 10).

When 16 consecutive attempts have been made at transmission and all have been terminated due to collision, the EDLC chip Transmit Processor sets an error status bit and issues an interrupt to the CPU if enabled.

Terminating Transmission

Transmission terminates under the following conditions:

***Normal:** The frame has been transmitted successfully without contention. Loading of the last data byte into the transmit FIFO is signaled to the EDLC chip by activation of the RxTxEOF signal concurrently with the last byte of data loaded into the transmit FIFO. This line acts as a ninth bit in the Transmit FIFO. When this last byte is serialized, the CRC is appended and transmitted concluding frame transmission. The transmit Ready-For-New-Frame bit of the Transmit Status register will be set by a normal termination.*

***Collision:** Transmission attempted by two or more Ethernet nodes. The Jam sequence is transmitted, the Collision status bit is set, the TxRET signal is generated, and the Backoff interval begun.*

***Underflow:** Transmit data is not ready when needed for transmission. Once transmission has begun, the EDLC chip on average requires one transmit byte every 800 nsec in order to avoid transmit FIFO underflow (starvation). If this condition occurs, the EDLC chip terminates the transmission, issues a TxRET signal, and sets the Transmit-Underflow status bit.*

***16 Transmission Attempts:** If a Collision occurs for the sixteenth consecutive time, the 16-Transmission-Attempts status bit is set, in addition to the Collision status bit. The TxRET signal is generated, and the backoff interval begun. The counter that keeps track of the number of collisions is modulo 16 and therefore rolls over on the 17th collision.*

At the completion of every transmission or retransmission, new status information is loaded into the Transmit Status Register. Dependent upon the bits enabled in the Transmit Command Register, an interrupt will be generated for the just completed transmission. In both collision and underflow the TxRET signal is activated.

Receiving

The EDLC chip is continuously monitoring the network. When activity is recognized via the Carrier Sense (CSN) line going active, the EDLC chip synchronizes itself to the incoming data stream during the Preamble, and then examines the destination address field of the frame. Depending on the Address Match Mode specified, the EDLC chip will either recognize the frame as being addressed to itself in a general or specific fashion or abort the frame reception.

Preamble Processing

The ELDC chip recognizes activity on the Ethernet via the Carrier Sense line. The Preamble is normally 64

© IC MASTER 1983

bits (8 bytes) long. The Preamble consists of a sequence of 62 alternating "1"s and "0"s followed by 11, with the frame information fields immediately following. In order for the decoder phase-lock to occur, the EDLC chip waits 8 bit times before looking for the 11, end of preamble indicator. If the EDLC chip receives a 00 before receiving the 11 in the preamble, an error condition has occured. The frame is not received, and the EDLC chip begins monitoring the network for a carrier again.

Address Matching

Ethernet addresses consist of two 6 byte fields. The first bit of the address signifies whether it is a Station address or a Multicast/Broadcast address.

First Bit	Address
0	Station Address (Physical)
1	Multicast/Broadcast Address (logical)

Address matching occurs as follows:

Station Address: All destination address bytes must match the corresponding bytes found in the Station Address register.

Multicast Address: If the first bit of the incoming address is a 1, and the EDLC chip is programmed to accept Multicast addresses, the frame is received.

Broadcast Address: The six incoming destination address bytes must all be FF hex. If the EDLC chip is programmed to accept Broadcast or Multicast Addresses the frame will be received.

If the incoming frame is addressed to the EDLC chip specifically (Destination Address matches the contents of the Station Address Register), or is of general or group interest (Broadcast or Multicast Address), the EDLC chip will pass the frame exclusive of preamble and FCS to the CPU buffer and indicate any error conditions at the end of the frame. If however the address does not match, as soon as the mismatch is recognized the EDLC chip will terminate reception and issue an RxDC if transfers to the CPU buffer have been initiated.

The EDLC chip may be programmed via the Match Mode bits of the Receive Command Register to ignore all frames (Disable Receiver), accept all frames (Promiscuous mode), accept frames with the proper Station Address or the Broadcast Address (Station/Broadcast), or accept all frames with the proper Station Address, the Broadcast Address, or all Multicast Addresses (Station/Broadcast/Multicast).

Terminating Reception

Reception is terminated when either of the following conditions occur:

Carrier Sense Inactive: Indicates that traffic is no longer present on the Ethernet cable.

Overflow: The host node for some reason is not able to empty the Receive FIFO as rapidly as it is filled, and an error occurs as frame data is lost. On average the Receive FIFO must be serviced every 800 ns to avoid this condition.

Frame Reception Conditions

Upon terminating reception, the EDLC chip will determine the status of the received frame and conditionally load it into the Receive Status Register. An interrupt will be issued if the appropriate conditions as specified in the Receive Command Register are present. The EDLC chip may report the following conditions at the end of frame reception:

Overflow: The EDLC chip internal receive FIFO overflows.

Dribble Error: Carrier Sense did not go inactive on a receive data byte boundary.

CRC Error: The 32-bit CRC transmitted with the frame does not match that calculated upon reception.

Short Frame: A frame containing less than 64 bytes of information was received (including FCS).

Good Frame: A frame is received that does not have a CRC, Shortframe, Dribble, or Overflow condition.

System Interface

The EDLC chip system interface consists of two independent busses and respective control signals. Data is read and written over the Receive/Transmit Data Bus RxTxD (0-7). These transfers are controlled by the TxRDY and $\overline{TxWR}$ signals for transmitted data, and RxRDY and $\overline{RxRD}$ for received data. All Commands and Station Addresses are written, and all Status read over a separate Command/Status Bus CdSt (0-7). These transfers are controlled by the $\overline{CS}$, $\overline{RD}$, $\overline{WR}$, and A0-A2 signals. The EDLC chip's command and status registers may be accessed at any time. However, it is recommended that writing to the command register be done only during interframe gaps.

With the exception of the two Match Mode bits in the Receive Command Register, all bits in both command registers are interrupt mask bits. Changing the interrupt mask bits during frame transmission does not affect the frame integrity. Asynchronous error events, however, e.g., overflow, underflow, etc., may cause chip operation to vary, depending on the condition of their corresponding mask bits.

© IC MASTER 1983

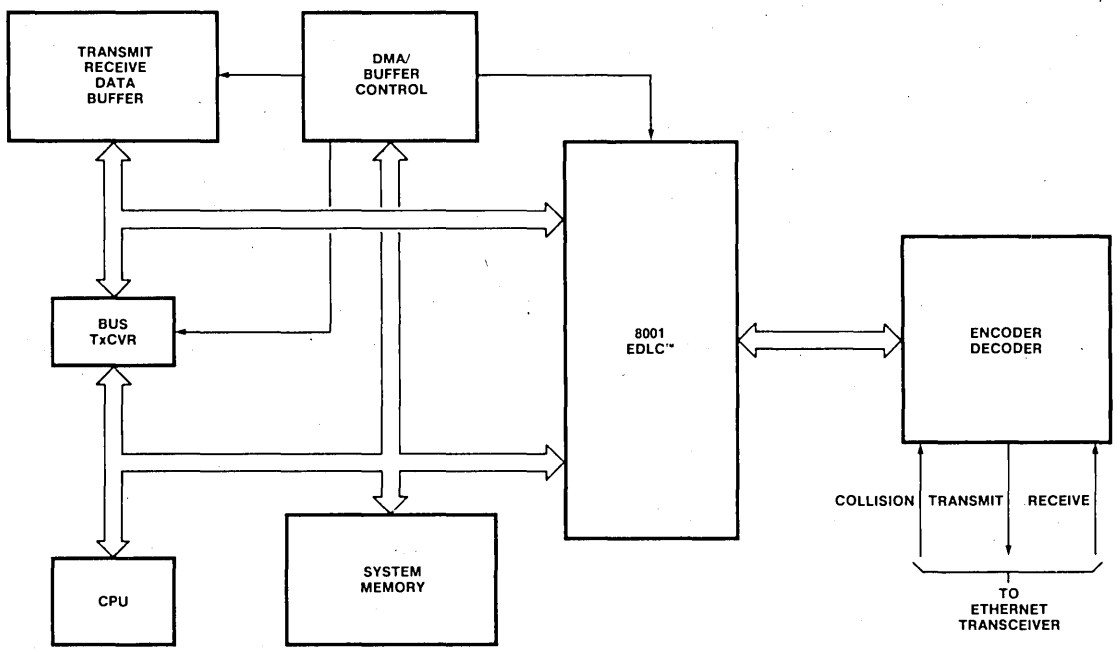

Figure 3. Typical Ethernet Node Configuration

Reading the Status registers may also occur at any time during transmission or reception. It is recommended, however, that to ensure stable status values that Status Registers be read during the interframe gap.

Internal Register Addressing

	Register Address			Register Description	
	A2	A1	A0	Read	Write
0	0	0	0	—	Station Addr 0
1	0	0	1	—	Station Addr 1
2	0	1	0	—	Station Addr 2
3	0	1	1	—	Station Addr 3
4	1	0	0	—	Station Addr 4
5	1	0	1	—	Station Addr 5
6	1	1	0	Rx Status	Rx Command
7	1	1	1	Tx Status	Tx Command

Status Registers are read only registers. Command and Station Address Registers are write only registers. Access to these registers is via the CPU interface: Control signals $\overline{CS}$, $\overline{RD}$, $\overline{WR}$, and the Command/Status Data Bus CdSt (0-7).

Station Address Register

The Station Address Register is 6 bytes in length. The contents may be written in any order, with bit "0" of byte "0" corresponding to the first bit received in the data stream, and indicating whether the address is physical or logical. Bit 7 of station address byte 5 is compared to the last bit of the received destination address. The Station Address should be programmed prior to enabling the receiver.

Transmit Command Register

The Transmit Command Register is an interrupt mask register, which provides for control of the conditions allowed to generate transmit interrupts. Each of the four least significant bits of the register may be individually set or cleared. When set, the occurrence of the associated condition will cause an interrupt to be generated. The four specific conditions for which interrupts may be generated are:

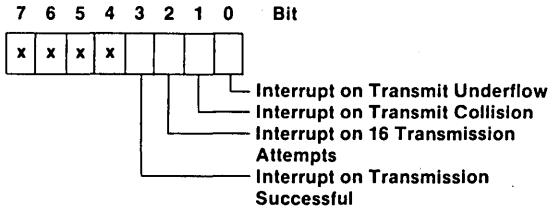
- *Underflow*
- *Collision*
- *16 Collisions*
- *Transmission Successful*

The interrupt signal INT will be set when one or more of the specified transmission termination conditions occurs and the associated command bit has been set. The interrupt signal INT will be cleared when the Transmit Status Register is read.

© IC MASTER 1983

All bits of the Transmit Command Register are cleared upon chip reset.

Transmit Command Register Format



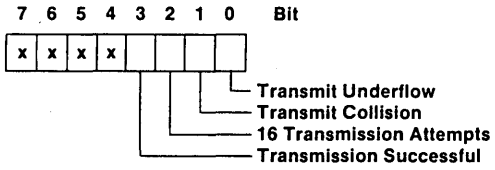
Transmission Successful is set only on the successful transmission or retransmission of a frame.

Transmit Status Register

The Transmit Status Register is loaded at the conclusion of each frame transmission or retransmission attempt. It provides for the reporting of both the normal and error termination conditions of each transmission.

All bits of the Transmit Status Register are cleared upon chip reset.

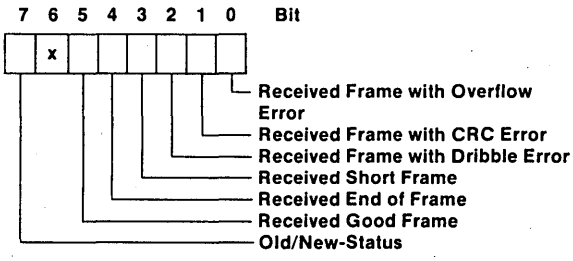
Transmit Status Register Format



Receive Status Register

The Receive Status Register is loaded with the status of each received frame when the frame has been received or frame reception has been terminated due to an error condition. In addition, this register contains an Old/New-Status bit which is set when the Receive Status Register is read or the chip is reset, and cleared only when new status is loaded for a Frame-of-Interest. All other bits are cleared upon chip reset.

Receive Status Register Format

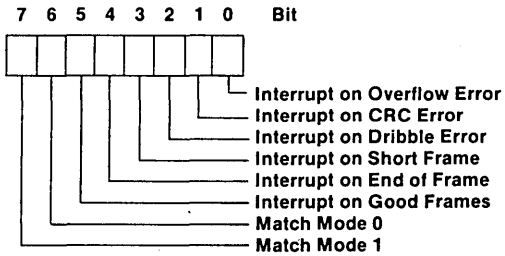


Receive Command Register

The Receive Command Register has two primary functions, it specifies the Address Match Mode, and it specifies Frames-of-Interest. i.e. frames whose arrival must be communicated to the CPU via interrupts and status register updates. Frames of Interest are frames whose status must be saved for inspection even at the expense of losing subsequent frames.

The definition of a Frame-of-Interest is set by the five interrupt mask bits in the Receive Command Register. Setting each bit allows an interrupt to be generated on the occurrence of the specified condition.

Receive Command Register Format



Bits 0-5 specify Frames-of-Interest

Changing the receive Match Mode bits, during frame reception, may change chip operation and give unpredictable results.

Match Mode Definition

	Match Mode 1	Match Mode 0	Function
0	0	0	Receiver Disable
1	0	1	Receive All Frames
2	1	0	Receive Station or Broadcast Frames
3	1	1	Receive Station, Broadcast/multicast Frames

The status of each frame is always loaded into the Receive Status Register on completion of reception unless (1) the previous frame was determined to be a Frame of Interest (i.e. had generated an interrupt) and (2) the previous frame status has not been read (as indicated by the Old/New status bit equal zero).

The Old/New status bit is cleared whenever the status of a new Frame-of-Interest is loaded into the Receive Status Register and is set whenever that status is read.

Thus the status of any frame received following the reception of a Frame-of-Interest will not be loaded into the Receive Status Register unless the previous status has been read. If any following frame is received

© IC MASTER 1983

before the status of the previous frame has been read, the Receive Discard (RxDC) signal will be issued.

The status of a Frame-of-Interest following a frame defined as "not of interest", will be loaded into the Receive Status Register, and the Old/New Status bit cleared.

These conditions ensure that a maximum number of good frames are received and retained.

Any Frame-of-Interest successfully received will cause an interrupt to be generated. This interrupt is reset upon reading the Receive Status Register.

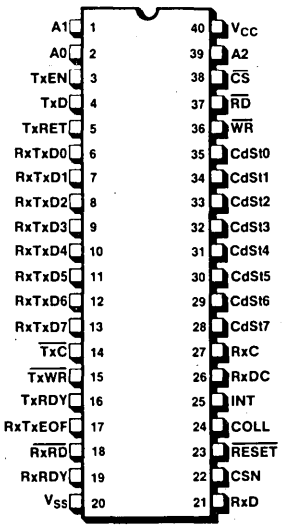


Figure 4. Pin Configuration

Pin Description

The EDLC chip has four groups of interface signals:

- *Power Supply*
- *Encoder/Decoder*
- *Data Buffer*
- *Command/Status*

Power Supply

V_{CC} ..... +5V
V_{SS} ..... Ground

Encoder/Decoder Interface

$\overline{TxC}$ Transmit Clock (Input): *10 MHz, 50% duty cycle transmit clock used to synchronize the transmit data from the EDLC chip to the Encoder. This clock runs continuously, and is asynchronous to RxC.*

TxD Transmit Data (Output): *Serial data output to the encoder. Active HIGH.*

TxEN Transmit Enable (Output): *This signal is used to activate the encoder. It becomes active with the first bit of the Preamble transmitted and inactive with the last bit of the frame transmitted. Active HIGH and forced low during Reset.*

RxC Receive Clock (Input): *10 MHz, 50% duty cycle nominal. The receive clock is used to synchronize incoming data to the EDLC chip from the Decoder. This clock runs continuously, and is asynchronous to $\overline{TxC}$.*

RxD Receive Data (Input): *Serial input data to the EDLC chip from the Decoder. Active HIGH.*

CSN Carrier Sense (Input): *Indicates traffic on the coaxial cable to the EDLC chip. Becomes active with the first bit of the preamble received, and inactive one bit time after the last bit of the frame is received. Active HIGH.*

COLL Collision (Input): *Indicates transmission contention on the Ethernet cable. Once activated must be active until EDLC chip terminates Jam pattern transmission to assure recognition. Active High.*

Data Buffer Interface

RxTxD (0-7) Receive/Transmit Data Bus (I/O): *Carries Receive/Transmit data byte from/to the EDLC chip Receive/Transmit FIFOs. Active HIGH.*

RxTxEOF Receive/Transmit End of Frame (I/O): *Indicates last byte of data on the Receive/Transmit Data Bus. Effectively a ninth bit in the FIFOs with the identical timing. Active HIGH.*

RxRDY Receive Ready (Output): *Indicates at least one byte of received data available in the Receive FIFO. $\overline{RxRD}$ should not be activated if this pin is LOW. Active HIGH.*

$\overline{RxRD}$ Receive Read Strobe (Input): *Enables transfer of received data from the EDLC Receive FIFO to the RxTxD bus. Data is valid from the EDLC chip Receive FIFO at the RxTxD pins on the rising edge of this signal. This signal should not be activated unless RxRdy is high. Active LOW.*

RxDC Receive Discard (Output): *Asserted when one of the following errors occur: overflow, shortframe, CRC, receive frame address non-match, or back-to-back Frames-of-Interest received with no status read in between. Active HIGH, and nominally active for 800 nsec.*

TxRDY Transmit Ready (Output): *Indicates that the EDLC chip internal FIFO has space available for transmit data bytes. Forced inactive during Reset. Active HIGH.*

© IC MASTER 1983

$\overline{TxWR}$ Transmit Write (Input): *Synchronizes data transfer from the RxTxD bus to the Transmit FIFO. Data is written to the FIFO on the rising edge of this signal. This signal should not be active unless TxRDY is high. Active LOW.*

TxRET Transmit Retransmit (Output): *Asserted whenever either transmit underflow or transmit collision conditions occur. It is nominally 800 nsec in width. Active HIGH.*

Command/Status Interface

CdSt (0-7) Command/Status Data Bus (I/O): *These lines carry commands and status as well as station address initialization information between the EDLC chip and CPU. These lines are nominally tristate until activated by $\overline{CS}$ and $\overline{RD}$ being simultaneously active. Active HIGH.*

A0-A2 Address (0-2) (Input): *Address lines to select the proper EDLC chip internal registers for reading or writing. Active HIGH.*

$\overline{CS}$ Chip Select (Input): *Chip Select input, must be active in conjunction with $\overline{RD}$ or $\overline{WR}$ to successfully access the EDLC chip internal registers. Active LOW.*

$\overline{RD}$ Read (Input): *Enables reading of the EDLC chip internal registers in conjunction with $\overline{CS}$. Read data from the internal registers is enabled via the falling edge of $\overline{RD}$ and is valid on the rising edge of the signal. Active LOW.*

$\overline{WR}$ Write (Input): *Enables writing of the EDLC chip internal registers in conjunction with $\overline{CS}$. Write data on the CdSt (0-7) data lines must be set up relative to the rising edge of the signal. Active LOW.*

INT Interrupt (Output): *Enabled as outlined above by a variety of transmit and receive conditions. Remains active until the status register containing the reason for the interrupt is read. Active HIGH.*

$\overline{RESET}$ (Input): *Resets the interrupt logic, clears command and status registers, asserts the TxRET signal, deactivates the RxRDY and TxEN lines, and initializes the pseudo-random backoff generator logic. Reset must be active for a minimum of 1 µsec. Active LOW.*

Absolute Maximum Ratings

Ambient Temperature
Under Bias ..... -10° C to +80° C
Storage Temperature ..... -65° C to +150° C
All Input or Output Voltages
with Respect to Ground ..... +7 V to -0.5 V
Package Maximum
Power Dissipation ..... 1.5 Watts

Operating Conditions

Ambient Temperature Range ..... 0° C to 70° C
V_{CC} Power Supply ..... 4.75 V to 5.25 V

Capacitance

T_A = 25° C, F_C = 1 MHz

Symbol	Parameter	Maximum	Condition
C_{IN}	Input Capacitance	15 pF	V_{IN} = 0 V
$C_{I/O}$	I/O Capacitance	15 pF	$V_{I/O}$ = 0 V

AC Test Conditions

Output Load: 1 Schottky TTL Gate + CL = 100 pF
(All pins except TxEN, TxD)
TxEN, TxD Load: 1 Schottky TTL Gate + CL = 35 pF
Input Pulse Level: 0.8 V to 2.0 V
Timing Reference Level: 1.5 V

DC Characteristics

T_A = 0° C to 70° C, V_{CC} = 4.75 V to 5.25 V

Symbol	Parameter	Limits[1] Min.	Typ.	Max.	Units	Condition
I_{IN}	Input Leakage Current			10	µA	V_{IN} = 0.45 V to 5.25 V
I_O	Output Leakage Current			10	µA	V_{OUT} = 0.45 V to 5.25 V
I_{CC}	Vcc Current		150	200	mA	
V_{CH}	Clock Input High Voltage	3.5		V_{CC} + 1	V	
V_{CL}	Clock Input Low Voltage			0.8	V	
V_{IL}	Input Low Voltage			0.8	V	
V_{IH}	Input High Voltage	2.0		V_{CC} + 1	V	
V_{OL}	Output Low Voltage			0.4	V	I_{OL} = 2.1 mA
V_{OH}	Output High Voltage	2.4			V	I_{OH} = -400 µA

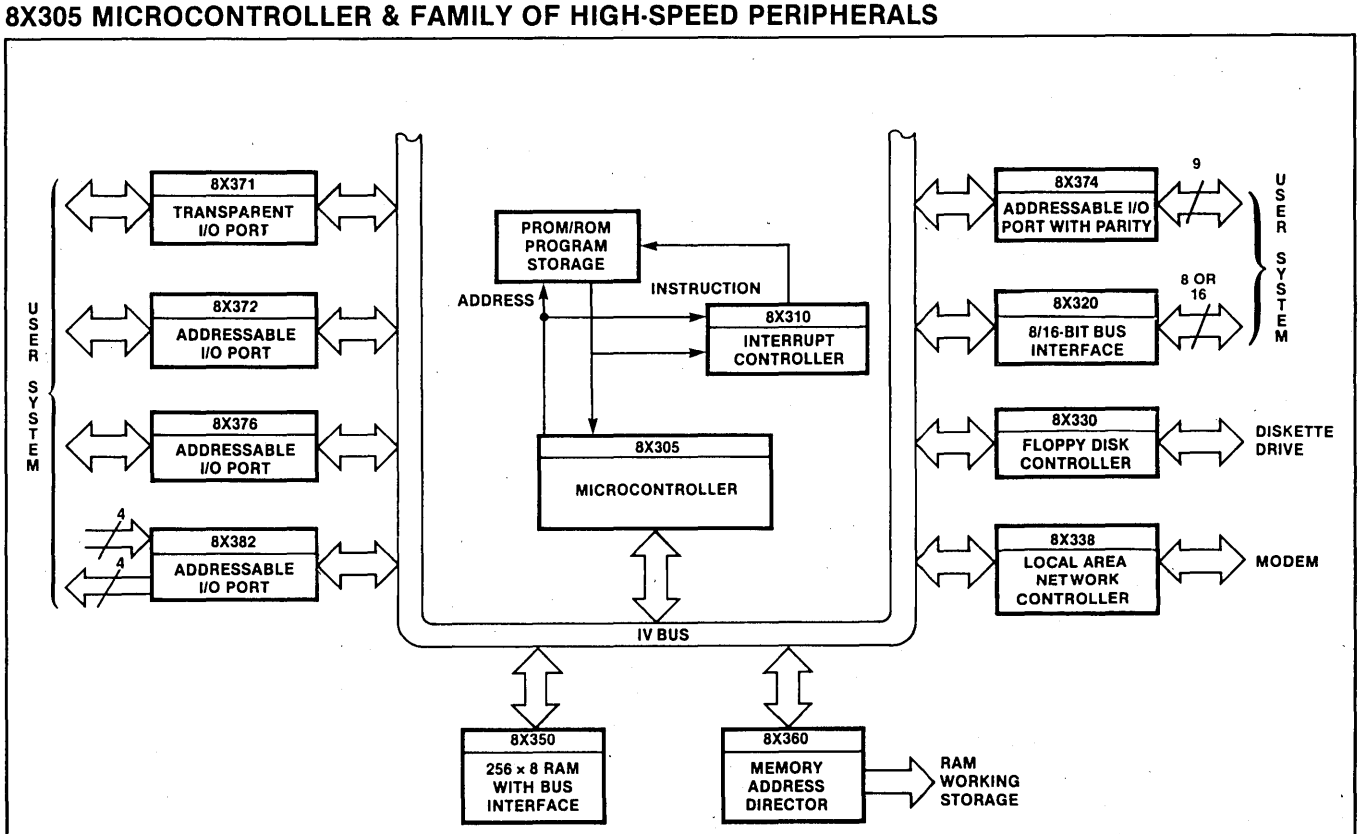
BIPOLAR MICROPROCESSORS 8X300 FAMILY

FEATURES	USER BENEFITS
■ MINIMUM PARTS COUNT	• Reduced Cost • Extended Life of Product
■ BIPOLAR DEVICE USING LOW-POWER SCHOTTKY TECHNOLOGY	• Full System Drive Without Buffering • TTL Compatibility • Proven Reliability
■ HIGH PERFORMANCE	• Instruction Cycle Time of 200ns (8X305) or 250ns (8X300) • Bit Addressability — Instruction Data Formats of 1-to-8 Bits Without Added Delay
■ SOURCE/DESTINATION ARCHITECTURE	• Efficient Use of Fixed Instruction Set • Easy to Program • Well-Suited for Control Applications
■ DESIGN FLEXIBILITY	• Single-Chip Processor • Full Complement of Support Devices
■ AFTER-SALES SUPPORT	• Development Systems • Training • Complete Documentation • Applications Support from Qualified Field Engineers

8X305 MICROCONTROLLER & FAMILY OF HIGH-SPEED PERIPHERALS



NOTES
1. The shaded devices are designed to take advantage of the improved performance of the 8X305.
2. Refer to "Reference Table" on next page for a descriptive summary of each part in the 8X300 Family.
3. The actual parts used in a specific system are selected based on the application requirements.

BIPOLAR MICROPROCESSORS 8X300 FAMILY

PRODUCT LINE OVERVIEW

The Bipolar LSI Microprocessor product line is centered around two high-speed Schottky-fabricated, MicroControllers and an ever-expanding family of I/O devices, support ICs, and development tools to expedite and simplify systems design. No other microprocessor product line offers the advantages of the 8X300 Family in systems that require intelligent control of high-speed data streams.

Both the "new generation (8X305)" and the "old generation (8X300)" MicroControllers can fetch, decode, and execute an instruction in one machine cycle (200ns for the 8X305 and 250ns for the 8X300). In a single instruction, data can be read from the bus, masked, shifted, an ALU operation performed, after which the data can be rotated, merged, and returned to the bus. The architecture and instruction set of each MicroController are designed to provide high data throughput with both bit and byte oriented operations. The 8X305 offers more on-chip registers and significant data handling capability improvements over the original 8X300.

Because of its extremely high performance, the 8X300 Family permits many applications that would normally require special hardware to be implemented in software. For example, using the 8X305 MicroController, the 8X338 Local Area Network Controller, program memory, and a few support devices, a complete Local Area Network controller can be built using less than ten ICs. The design is programmable and provides complete support for the proposed IEEE802 token pass standard.

The 8X300 Family is implemented using bipolar, Low-power Schottky technology to provide TTL speeds and drive capability without additional buffering. In addition, the family is compatible with most special-purpose devices often required in control applications. The excellent environmental characteristics of the technology make the 8X300 Family ideal for military applications as well.

To simplify design with the 8X300 Family of parts, a complete complement of development-support tools is available. A self-contained universal development system that supports full speed in-circuit emulation is available; also available are evaluation and demonstration systems. Software modules are provided so that mainframes or minicomputers can be used to generate compatible software. Complete documentation is in place, including both data sheets and comprehensive reference manuals. To supplement these tools, Signetics employs a large, professional staff of applications engineers both in the field and at the factory to support your design efforts.

REFERENCE TABLE FOR 8X300 FAMILY

PART DESIG		PRODUCT DESCRIPTION	FUNCTION
NEW GEN	OLD GEN		
	8X300	MicroController	250ns processor for I/O and data control

MICROCONTROLLER 8X305 AND 8X300

N8X305N, N8X305I, S8X305I, N8X300I

PRODUCT DESCRIPTION

The Signetics 8X305 MicroController is a high-speed bipolar microprocessor implemented with low-power Schottky technology. In a single chip, the 8X305 combines speed, flexibility, and a bit-oriented instruction set. These features and other basic characteristics of the chip combine to provide cost-effective solutions for a broad range of applications. The 8X305 is particularly useful in systems that require high-speed bit manipulations — sophisticated controllers, data communications, very fast interface control, and other applications of a similar nature.

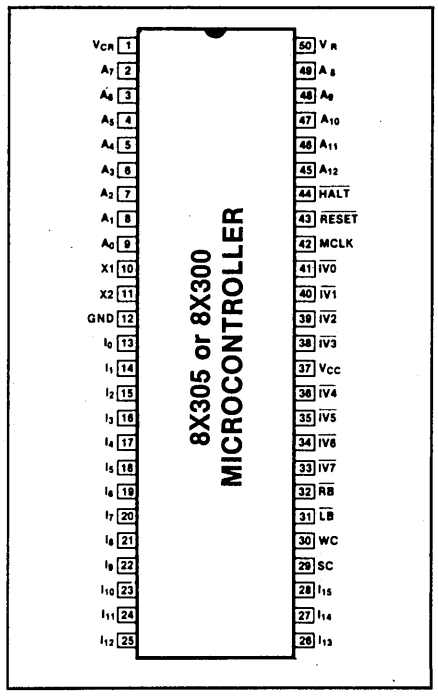
The 8X305 can fetch, decode, and execute a 16-bit instruction word in a minimum of 200 nanoseconds. Within one instruction cycle, the 8-bit data-processing path can be programmed to rotate, mask, shift, and/or merge single or multiple bit subfields and, in addition, perform an ALU operation; in the same instruction, an external data field can be input, processed, and output to a specified destination — likewise, single or multiple bit data fields can be internally moved from a given source to a given destination. To summarize, fixed or variable-length data fields can be fetched, processed, operated on by the ALU, and moved to a different location — all in a timeframe of 200 nanoseconds. To interface with I/O and program memory, the 8X305 uses a 13-bit instruction address bus, a 16-bit instruction bus, an 8-bit bidirectional multiplexed I/O data/address bus and a 5-bit I/O control bus.

A wide selection of I/O devices, interface chips, and special-purpose parts are available for systems use. In most applications, the more powerful 8X305 is functionally interchangeable with its predecessor — the 8X300.

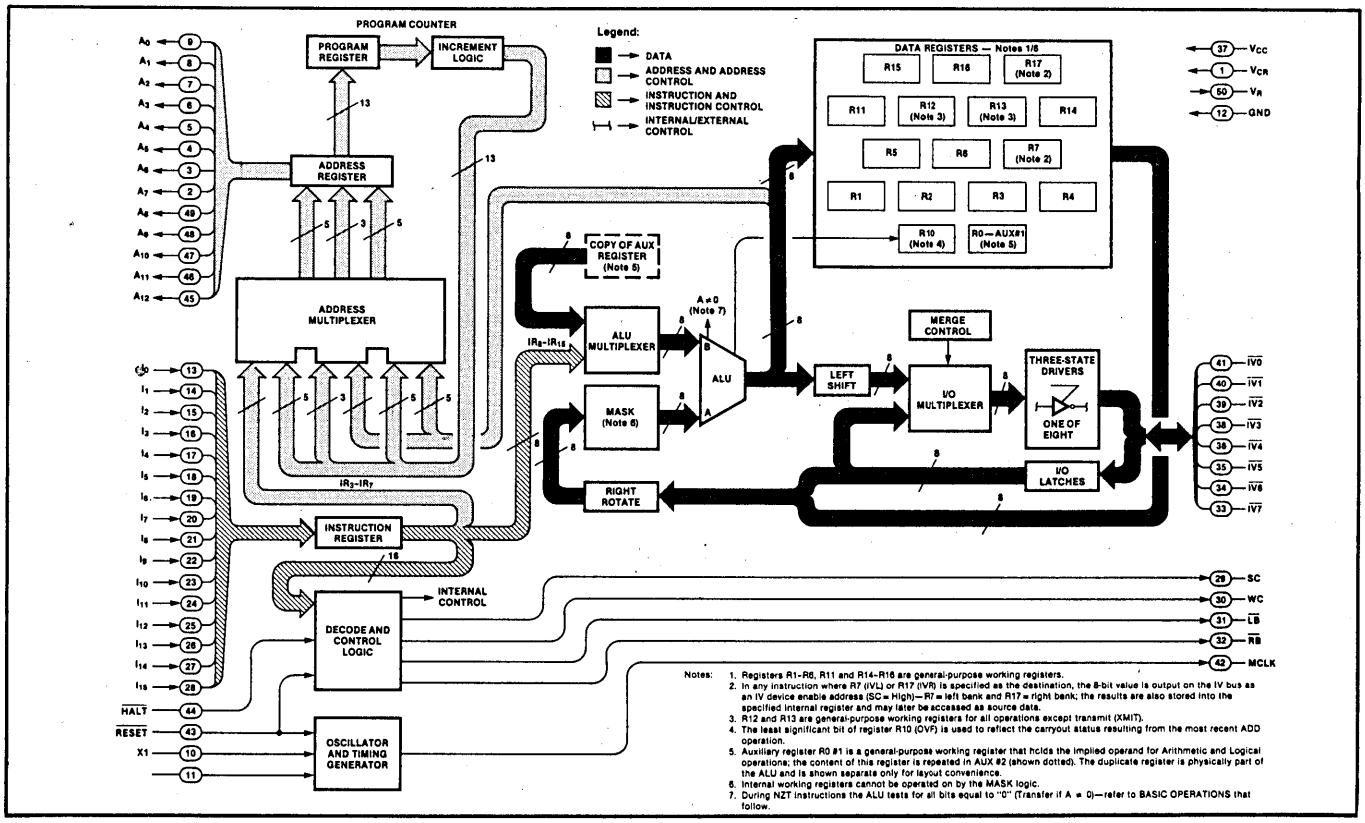
FEATURES

- **Fetch, Decode, and Execute a 16-bit instruction in one machine cycle —**
  8X305: Commercial = 200ns
  Military = 250ns
  8X300: Commercial = 250ns
- **Bit-oriented instruction set (addressable single-or-multiple bit subfields)**
- **Separate buses for Instruction, Instruction Address and I/O (Three-State I/O for 8X305)**
- **Thirteen 8-bit general-purpose working registers for 8X305 (Eight 8-bit working registers for 8X300)**
- **Source/destination architecture**
- **Bipolar low-power Schottky technology/TTL inputs and outputs**
- **On-chip oscillator and timing generation**
- **Single +5V supply**
- **0.9-in. 50-pin DIP**

PIN CONFIGURATION



BLOCK DIAGRAM OF 8X305 MICROCONTROLLER



Notes:
1. Registers R1-R6, R11 and R14-R16 are general-purpose working registers.
2. In any instruction where R7 (IVL) or R17 (IVR) is specified as the destination, the 8-bit value is output on the IV bus as an IV device enable address (SC = High)—R7 = left bank and R17 = right bank; the results are also stored into the specified internal register and may later be accessed as source data.
3. R12 and R13 are general-purpose working registers for all operations except transmit (XMIT).
4. The least significant bit of register R10 (OVF) is used to reflect the carryout status resulting from the most recent ADD operation.
5. Auxiliary register R0 #1 is a general-purpose working register that holds the implied operand for Arithmetic and Logical operations; the content of this register is repeated in AUX #2 (shown dotted). The duplicate register is physically part of the ALU and is shown separate only for layout convenience.
6. Internal working registers cannot be operated on by the MASK logic.
7. During NZT instructions the ALU tests for all bits equal to "0" (Transfer if A ≠ 0)—refer to BASIC OPERATIONS that follow.

I/O PORTS 8X300 FAMILY

PRODUCT DESCRIPTION

The 8X300 MicroController Family is supported by a series of I/O Ports designed to simplify interfacing with the IV bus. These devices are bidirectional latches designed for direct attachment to the MicroController's IV bus and control signals. They are available in a wide variety of different configurations as shown in the table below to support the vast majority of design alternatives. Addressable versions of the devices are available with the IV bus address preprogrammed at the factory, or can be ordered unaddressed for subsequent programming by the user (a programming module is available from Data I/O). The 8X371, 8X372, 8X374, 8X376, and 8X382 are capable of operation at a 200ns cycle for full-speed suport of Signetics 8X305 MicroController; other ports in the family will support the 8X300. The recently announced 8X374 provides parity checking and generation in addition to the functions of the other devices, and is ideal for use in mainframe or military applications where extremely high data integrity assurance is required. While the devices are specifically designed for operation with the 8X300 MicroController Family, numerous applications use the devices independently due to their speed and versatility. The 8X300 Family I/O Ports are implemented using Bipolar Low-Power Schottky technology.

INTERRUPT CONTROL COPROCESSOR 8X310

N8X310N, N8X310I, S8X310I

PRODUCT DESCRIPTION

The Signetics 8X310 Interrupt Control Coprocessor (ICC) supports the 8X305 MicroController in systems that are interrupt driven and those that require subroutine handling capabilities. As shown in the System Configuration, the ICC monitors the binary flow of information on the instruction and address busses to capture and decode all instructions relating to the interrupt and subroutine-handling capabilities of the device. These instructions are five in number — *Set Mask*, *Clear Mask*, *Push*, *Return*, and *Clear Interrupt*.

All ICC instructions are treated as NOPs by the MicroController; likewise, valid instructions of the 8X305 are perceived as NOPs by the ICC.

The user can initiate up to three interrupts via prioritized inputs INT 0, INT 1, and INT 2—the highest priority being INT 0 and the lowest being INT 2. the status of each interrupt input is automatically sampled during each instruction cycle of the MicroController. When an interrupt is acknowledged, the ICC forces the MicroController to jump to a preassigned location in Program Memory. Each preassigned memory location corresponds to a specific interrupt, that is, address 4 is assigned to INT 0, address 5 to INT 1, and address 6 to INT 2. In each of the three locations, the user stores a branch to a vector address instruction in Program Memory where the appropriate interrupt service routine is located. Addresses 4, 5, and 6 are dedicated memory locations and address 0 is always decoded as a reset instruction; addresses 1, 2, and 3 are available for initialization and other setup operations of the system.

The ICC can efficiently handle subroutine branches from the main program or subroutine branches nested in the interrupt service routine; in either case, the limiting factor is the number of vacancies in the LIFO stack. The user can program the ICC to set or clear interrupt masks and, if desired, to clear all pending interrupts.

In short, the ICC brings some unique and very flexible facilities to an 8X350-based system. Besides the interface management that prevents race conditions and conflicting actions within the system, the ICC also offers the user some software capabilities that improves efficiency and minimizes memory space. These features, both from a chip and system point-of-view, are described in subsequent paragraphs.

FEATURES

- **Three Maskable, Prioritized Interrupts**
- **Subroutine Handling Capabilities**
- **4-Level LIFO Stack**
- **Interrupt Disable**
- **Stack Full Flag**
- **Directly Compatible with 8X305 MicroController**
- **Bipolar ISL and Low-Power Schottky Technology**
- **Single +5V Power Supply**
- **40-Pin DIP**

BUS INTERFACE REGISTER ARRAY 8X320

N8X320N

PRODUCT DESCRIPTION

The Signetics 8X320 Bus Interface Register Array is a dual-port RAM memory designed for use between a host processor and a peripheral processor. Specifically, the register array provides a convenient and economical interface between the 8X305 Micro-Controller (secondary port) and User's Host System (primary port); the host can be almost any bus-oriented device—another processor, a minicomputer, or a mainframe computer. The host has 8-bit (byte) or 16-bit (word) access to the primary port; data can be read-from or written-into any memory location as determined by the primary-port address and control lines. The secondary port (8X305 bus) consists of eight input/output lines and four bus control lines. To implement the secondary-port interface, an 8-bit memory location is addressed during one machine cycle and, during another cycle, data is read or written under control of the secondary (8X305) processor. Both primary and secondary ports feature three-state outputs and both ports are bidirectional.

Besides the convenience and economy of a two-port memory, the array also provides simple handshake control via two 8-bit flag registers, logic to facilitate DMA transfers, and a write-protect feature for the primary port in both byte and word modes of operation.

FEATURES

- **16-Byte/2-Port interface**
- **8 or 16 Bit primary-port (Host) interface (user selectable)**
- **8-Bit secondary-port interface**
- **Two 8-Bit flag registers (handshake control)**
- **DMA or programmed I/O operation**
- **Two Three-State Bidirectional Ports**
- **Secondary Port is bus compatible with 8X305**
- **Single 5V supply**
- **40-Pin package**

N8X330N

PRODUCT DESCRIPTION

The Signetics 8X330 Floppy Disk Formatter/Controller is a special purpose member of the 8X300 Family designed to provide all control and data transfer functions required for diskette drives. The device is programmable, permitting the use of virtually any format on the diskette. It is capable of data rates of up to 1 Megabit/second to support both current generation and future drives. The 8X330 is unique among Floppy Disk controller ICs in that all functions and encoding schemes are supported on the chip, including a PLL data separator, write precompensation, address mark and preamble detection, and power failure protection. In addition, 16 bytes of scratchpad RAM are provided for storage of control and status parameters. Twelve user definable command and status lines are also provided for. Using the 8X330 coupled with an 8X305 MicroController and an external low pass filter, a complete controller can be built using less than ten ICs. If desired, Error Checking and Correction (ECC) can be implemented in 8X305 software since the 8X330 optionally provides the CRC remainder required to perform correction. The 8X330 Floppy Disk Formatter/Controller is implemented using a combination of Bipolar Schottky and I^2L technologies to provide these advanced functions.

FEATURES

- **Single or double density encoding/decoding**
- **On-chip data separator**
- **Programmable:**
  - **FM, MFM, and M^2FM encoding/decoding**
  - **Preamble Polarity**
  - **Data transfer rate**
  - **Address mark encoding/decoding**
  - **Sector length**
  - **Output port (7-bits disk command)**
  - **Input port (5-bits disk status)**
- **Write Precompensation with on/off control**
- **On-chip phase lock loop**
- **CRC generator with software-controlled error correction capabilities**
- **40-pin package**
- **+5 volt operation**

LOCAL AREA NETWORK CONTROLLER 8X338

N8X338N

PRODUCT DESCRIPTION

The Signetics 8X338 Local Area Network Controller is a special purpose member of the 8X300 Family that provides the control and data handling functions required to interface with a Local Area Network that conforms with the proposed IEEE802 token-pass standard. The device is programmable, permitting the flexibility required to work with the standard as it evolves. The device operates at a data rate of 1 Megabit/second, as required for the current baseband specification. The first monolithic controller that supports the token-pass protocol, the 8X338 provides all modem control functions required by the proposed standard and supports Differential Manchester encoding/decoding through an on-chip PLL data separator. In addition to preamble header detection and power failure protection, the 8X338 contains 16 bytes of scratchpad RAM for storage of control and status parameters. Command and status lines are user definable. Using the 8X338 Local Area Network Controller coupled with an 8X305 MicroController and an external low pass filter, a complete node controller can be built using less than 10 ICs, as shown in the block diagram below. Error Checking and Correction (ECC) is implemented in 8X305 software. The 8X338 Local Area Network Controller is implemented using a combination of Bipolar Schottky and I^2L technologies to provide these advanced functions.

FEATURES

- **Supports Differential Manchester encoding**
- **1 MBit/sec data transfer rate**
- **On-chip PLL data separator**
- **Compatible with proposed IEEE802 token pass**
- **Sixteen 8-bit scratchpad registers**
- **User definable control and status lines**

2048-BIT BIPOLAR RAM (256×8) 8X350

N8X350N, N8X350F

DESCRIPTION

The 8X350 bipolar RAM is designed principally as a working storage element in an 8X305-based system. Internal circuitry is provided for direct use in 8X305 applications. When used with the 8X305 the RAM address and data busses are tied together and connected to the IV bus of the system.

The data inputs and outputs share a common I/O bus with 3-state outputs.

The 8X350 is available in commercial and military temperature ranges.

FEATURES

- **On-chip address latches**
- **3-state outputs**
- **Schottky clamped TTL**
- **Internal control logic for 8X305 system**
- **Directly interfaces with the 8X305 Bipolar MicroController with no external logic**

MEMORY ADDRESS DIRECTOR 8X360

N8X360N, N8X360I, S8X360I

PRODUCT DESCRIPTION

The 8X360 Memory Address Director (MAD) is a high-performance member of the 8X300 Family that generates sequential memory addresses to facilitate the transfer of data to and from memory. The MAD provides a highly-efficient and cost-effective solution for DMA and other applications requiring large working-storage memories and high-speed data transfers. Once initialized with such information as starting address, ending address, byte count, address increment, address decrement, etc., the 8X360 performs all bookkeeping chores automatically and all address-management software is off-loaded from the processor. The 8X360 can be addressed by conventional means or by extended microcode; system status is available to the user via I/O pins.

FEATURES

- **Address control for working storage**
- **16-bit addressing capability**
- **Byte and word addressing support**
- **Automatic increment and decrement**
- **11 Address and word-count registers**
- **Reduces number of 8X305 instructions required**

BUS EXPANDERS 8T39/8T58

N8T39N, N8T58N

DESCRIPTION

The Bus Expander is specifically designed to increase the I/O capability of 8X300 systems previously limited by fanout considerations. The bus expander serves as a buffer between the 8X300 and blocks of I/O devices. Each bus expander can buffer a block of 16 I/O ports while only adding a single load to the 8X300.

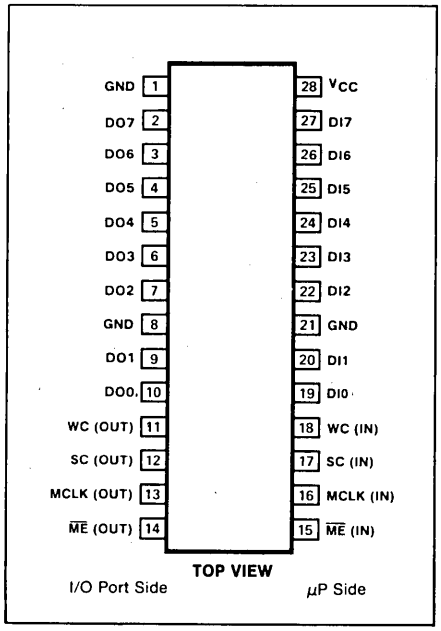
8T39 FEATURES

- **15ns max propagation delay**
- **Bidirectional**
- **Three-state outputs on both ports**
- **Pre-programmed address range**

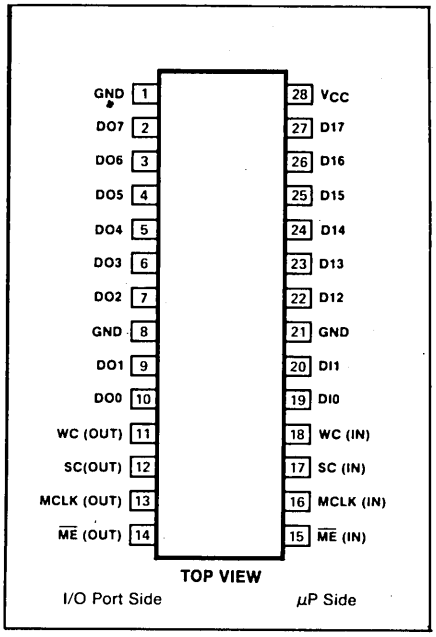
8T58 FEATURES

- **15ns max propagation delay**
- **Bidirectional**
- **Three-state outputs on both ports**

PIN CONFIGURATION—8T39



PIN CONFIGURATION—8T58



BIPOLAR LSI DIVISION

PRODUCT SUPPORT 8X300 FAMILY

SUPPORT FACILITIES

The 8X300 Family is strongly supported with Development Systems, Support Software, Applications, Training and Documentation. Together, this support provides the user with a powerful set of tools to evaluate, design, debug, and implement a simple or complex system.

DEVELOPMENT SYSTEMS

EZ-PRO (Manufactured by American Automation)

- Universal Development System
- Relocating macroassembler
- Full speed in-circuit emulator/debugger
- Maximum memory support

8X305 ICEPACK (Manufactured by Sigen Corp.)

- Full speed in-circuit emulator/debugger
- RS-232 interface to CP/M or Intellec
- 4K word memory/8-bit extended microcode
- Low cost

Signetics 8X305 Prototyping System

- Single board module
- RS-232 interface
- Resident monitor
- 256 to 4096 words of Writable Control Storage
- Minimum cost

SOFTWARE

MCCAP CrossAssembler

- Full function macroassembler
  - — Free format source code
  - — Symbolic address assignment
  - — Nested macro support
  - — Cross-reference table
  - — Supports extended microcode
- Multiple output formats
- Availabe in two versions
  - — FORTRAN source code
  - — Intellec/ISIS object code

APPLICATIONS SUPPORT

Field applications engineers
Product applications engineers
Application notes

- Floppy disk controller
- ECC
- Hard disk controller
- Local network interfacing

TRAINING AND DOCUMENTATION

- Videocassette training course
- Designer's seminar
- 8X305 User's Manual
- 8X300 Family Product Capabilities Manual
- MCCAP Programming Manual
- Full complement of Data Sheets

MICROPROGRAM CONTROL UNIT SN3001

N3001N, N30011, S3007I

DESCRIPTION

The SN3001 MCU is 1 element of a bipolar microcomputer set. When used with the SN3002, 54/74S182, ROM or PROM memory, a powerful microprogrammed computer can be implemented.

The 3001 MCU controls the fetch sequence of microinstructions from the microprogram memory. Functions performed by the 3001 include:

- Maintenance of microprogram address register
- Selection of next microinstruction address
- Decoding and testing of data supplied via several input buses
- Saving and testing of carry output data from the central processing (CP) array
- Control of carry/shift input data to the CP array
- Control of carry/shift input data to the CP array

FEATURES

- **Schottky TTL process**
- **45ns cycle time (typ.)**
- **Direct addressing of standard bipolar PROM or ROM**
- **512 microinstruction addressability**
- **Advanced organization:**
  - **9-bit microprogram address register and bus organized to address memory by row and column**
  - **4-bit program latch**
  - **2-flag registers**
- **11 address control functions:**
  - **3 jump and test latch function**
  - **16 way jump and test instruction**
- **8 flag control functions:**
  - **4 flag input functions**
  - **4 flag output functions**

CENTRAL PROCESSING ELEMENT SN3002

S30021, N3002F, N3002N

DESCRIPTION

The N3002 Central Processing Element (CPE) is one part of a bipolar microcomputer set. The N3002 is organized as a 2-bit slice and performs the logical and arithmetic functions required by microinstructions. A system with any number of bits in a data word can be implemented by using multiple N3002s, the N3001 microcomputer control unit, the N74S182 carry look-ahead unit and ROM or PROM memory.

FEATURES

- **45ns cycle time (typ)**
- **Easy expansion to multiple of 2 bits**
- **11 general purpose registers**
- **Full function accumulator**
- **Useful functions include:**
  - **2's complement arithmetic**
  - **Logical AND, OR, NOT, exclusive-NOR**
  - **Increment, decrement**
  - **Shift left/shift right**
  - **Bit testing and zero detection**
  - **Carry look-ahead generation**
  - **Masking via K-bus**
  - **Conditioned clocking allowing non-destructive testing of data in accumulator and scratchpad**
- **3 input buses**
- **2 output buses**
- **Control bus**

CONTROL STORE SEQUENCER 8X02A

N8X02AN

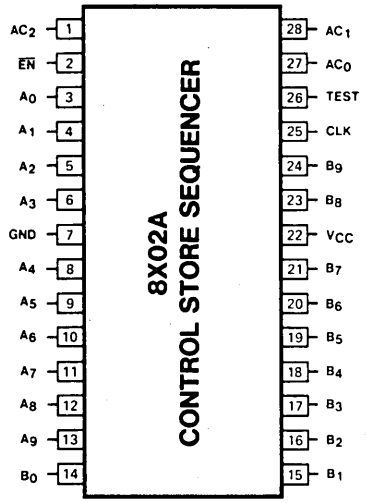
PRODUCT DESCRIPTION

The Signetics 8X02A Control Store Sequencer generates addresses to access instructions from a microprogram memory (control store). This high-speed device provides an efficient means of controlling the flow through a microprogram with a powerful set of sequencing functions. The 8X02A can directly address up to 1024 microinstructions; however, the total address space can be expanded by adding conventional paging techniques. Combined with memory, the 8X02A forms a powerful control section for CPU's, controllers, test equipment, and other microprogram-controlled systems.

FEATURES

- **10-Bit Address Generator (1024 Microinstruction Addressability)**
- **Operating Frequency Exceeding 12 MHz**
- **Direct Branching Over Full Address Range**
- **Conditional Branching**
- **Subroutine Branching Capability**
- **4-Level Stack Register File**
- **Loop Control Facility Using Stack**
- **Three-State Address Outputs**

8X02A PACKAGE AND PIN DESIGNATIONS



PIN NO.	IDENTIFIER	FUNCTION
1, 28, 27	AC_2-AC_0	Inputs used to select any one of eight Address Control Functions—see Table 1.
2	$\overline{EN}$	Enable three-state address outputs (A_0-A_9); active-low input.
3-6, 8-13	A_0-A_9	Three-state address outputs used to specify microprogram address; (A_0 = LSB, A_9 = MSB).
7	GND	Ground.
14-21, 23, 24	B_0-B_9	Branch address inputs: (B_0 = LSB, B_9 = MSB).
22	V_{CC}	Supply voltage.
25	CLK	Clock input (positive edge used for all triggering).
26	TEST	Active-high condition input used to determine conditional skips, branches, subroutine calls, and loop termination.

CRC GENERATOR/CHECKER 8X01A/9401

8X01AF, 8X01AN, N9401I, N9401N

PRODUCT DESCRIPTION

The CRC Generator/Checker (8X01A or 9401) provides error-correction capabilities for digital systems that handle serial data. The two parts differ in that the 8X01A provides Synchronous Data Link Control (SDLC).

The serial data stream is divided by a selected polynomial; the remainder resulting from this algebraic process is transmitted at the end of the data stream as a Cyclic Redundancy Check Character (CRCC). At the receiving end, the same calculation is performed on the data. If the received message is error-free, the calculated remainder should satisfy a predetermined pattern. In most cases, the remainder is zero; however, where SDLC protocols (8X01A only) are used, the correct remainder is 1111000010111000 (X^0-X^{15}).

Eight polynomials are provided and any of these can be selected via a 3-bit control bus. Popular polynomials, such as CRC-16 and CCITT are implemented and the one selected can be programmed to start with all zeroes or all ones. Right justification for polynomials of degree less than 16 is automatic.

FUNCTIONAL OPERATION

8X01A and 9401

The CRC Generator/Checker circuit provides a means of detecting errors in a serial data communications environment. A binary message can be interpreted as a binary polynomial H(x). This polynomial can be divided by a generator polynomial P(x) such that $H(x) = P(x)\,Q(x) + R(x)$ whereby Q(x) is the quotient and R(x) is the remainder. During transmission, the remainder is appended to the end of the message as check bits. For a given message, a unique remainder is generated.

Each polynomial can be selected via control inputs S_0, S_1 and S_2. To generate the check bits, the data stream is entered via the Data (D) input, using the high to low transition of the Clock ($\overline{CP}$) input. This data is gated with the most significant output (Q) of the shift register which, in turn, controls the exclusive OR gates. The Check Word Enable (CWE) must be held high while the data is being entered. After the last data bit is entered, the CWE is brought low and the check bits are shifted out of the register and appended to the data bits using external gating.

To check an incoming message for errors, both the data and check bits are entered through the "D" input with the CWE input held high. The 8X01A while not in the data path, monitors the message. After the last check bit is entered, in the 8X01A, the ERror output is made valid by a high-to-low transition of CP. If no error is detected during the data transmission, all bits of the internal register are low and the ERror output is also low; if an error is detected, it is reflected by the bit pattern and the ERror output is high. The ERror output status remains valid until the next high-to-low transition of CP or until initialized by the preset (P) or reset (MR) functions. The PME line must be high if the ERror output is used to indicate an all-zero result.

A high level applied to the Master Reset (MR) input asynchronously clears the shift register. A low level applied to the Preset (P) input asynchronously sets all bits to the appropriate state if the control-code inputs (S_0, S_1, and S_2) specify a 16-bit polynomial. In the case of check polynomials that are 8-or-12 bits in length, only the most significant 8-or-12 bits of the shift register are set; all remaining bits are cleared.

8X01A ONLY

For data communications using the Synchronous Data Link Control (SDLC) protocol, the 8X01A is preset to an all-ones configuration before any accumulation is done; this applies to both transmitting and receiving modes of operation. Using SDLC, the check sum shifted out of the 8X01A must be inverted.

During the receiving mode, a special pattern of 1111000010111000 (X^0-X^{15}) is used in place of all-zeroes to check for a valid message. The Pattern Match Enable pin allows the user to select this option. If $\overline{PME}$ is low during the last bit time of the message, the ERror output is low providing the result matches the special pattern; if an error occurs, ER is high.

DESIGN FEATURES

- **TTL inputs/outputs**
- **12MHz (Max) data rate**
- **Separate preset/reset controls**
- **SDLC specified pattern match (8X01A only)**
- **Automatic right justification**
- **V_{CC} = 5V**
- **14-Pin DIP**

8X01A & 9401 PACKAGE/PIN DESIGNATOR

64-BIT FIFO BUFFER MEMORY (16×4) 9403

N9403N

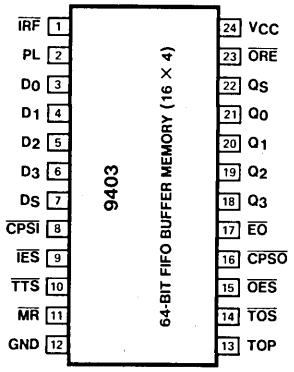
PRODUCT DESCRIPTION

The 9403 is an expandable fall-through type First-In First-Out (FIFO) Buffer Memory that is optimized for high-speed disc/tape controllers and communication-buffer applications. In multiples of four, the device can be expanded to any number of bits and subsequently, to any number of words. Serial or parallel data can be asynchronously entered or retrieved which makes the 9403 *the* cost-effective solution for implementing buffer memories.

FEATURES

- **10MHz Serial or Parallel Data Rate**
- **Serial or Parallel Input and Output**
- **Expandable Without External Logic**
- **Three-State Outputs**
- **Fully TTL-Compatible**
- **Slim (0.4 in.) 24-Pin DIP**

PIN DESIGNATIONS & DESCRIPTIONS



MNEMONIC AND FUNCTION		DESCRIPTION
$\overline{IRF}$	= Input register full output	Low when input register is full
PL	= Parallel load input	High on PL enables D_0-D_3; not edge-triggered, 1's catching
D_0-D_3	= Parallel data input	—
D_S	= Serial data input	—
$\overline{CPSI}$	= Serial input clock	Edge-triggered and activates on falling edge
$\overline{IES}$	= Serial input enable	When low, serial input is enabled
$\overline{TTS}$	= Transfer to stack input	When low, initiates fall-through
$\overline{MR}$	= Master Reset	Active low
TOP	= Transfer out parallel input	When high and $\overline{TOS}$ is low, enables word transfer from stack to output register—not edge-triggered

MNEMONIC AND FUNCTION		DESCRIPTION
$\overline{TOS}$	= Transfer out serial input	When low and TOP is high, enables word transfer from stack to output register—not edge-triggered
$\overline{OES}$	= Serial output enable input	When low, enables serial output
$\overline{CPSO}$	= Serial output clock input	Edge-triggered and activates on falling edge
$\overline{EO}$	= Output enable	Active low
Q_0-Q_3	= Parallel data output	
Q_S	= Serial data output	
$\overline{ORE}$	= Output register empty output	When high, output register contains valid data
GND	= Ground	—
V_{CC}	= Supply voltage	+5 volts

BIDIRECTIONAL BUS EXTENDER/REPEATER 8X41

N8X41F, N8X41N

PRODUCT DESCRIPTION

The Signetics Asynchronous Bidirectional Bus Extender and Repeater is a general purpose device ideal for system bus expansion applications. The 8X41 consists of eight data channels, each with one pair of terminals (A_i and B_i); each data channel can be operated independently.

The device requires no external controls since all intelligence is internally generated; thus, operation of the device is completely autonomous. The first logic low signal that occurs on one channel terminal (A_i or B_i) will be repeated on the corresponding terminal (B_i or A_i) of the same channel.

FUNCTIONAL OPERATION

As shown, the 8X41 consists of eight functionally independent yet logically identical channels. Each channel consists of two bus terminals (A_i and B_i); each terminal is internally connected to an open-collector driver and a high-impedance receiver. The monitoring state of each channel is defined when both terminals (A_i and B_i) are "high"; in this state, the internal logic of the 8X41 continually examines the A and B bus signals to determine signal direction—A_i to B_i or B_i to A_i. A low signal occurring at either of the two terminals causes the open-collector driver on the opposite terminal to follow suit; hence, the signal is repeated by the 8X41. For each channel, latches L1 and L2 determine signal direction.

The internal automatic direction control can be overridden by either or both of the common disable inputs—DBA and DAB. When DBA is driven low (DAB = high), the B_i to A_i path is interrupted and the 8X41 becomes a unidirectional repeater in the A_i to B_i direction only. With these conditions reversed (DAB = low and DBA = high), the A_i to B_i path is interrupted and the chip functions as a unidirectional repeater in the B_i to A_i direction. When both control signals are low, data passage is inhibited in both directions.

DESIGN FEATURES

- **Intelligent bidirectional bus repeater with self-generating or external control**
- **Eight independent channels**
- **Open-collector outputs (meets DEC UNIBUS* specifications)**
- **TTL compatible**
- **High speed (30-nanoseconds max)**
- **Expandable to any number of bits**
- **High input impedance for every operating value of V_{CC}**
- **Low input current (less than 100-microamperes); high output current (up to 70-milliamperes)**
- **24-pin DIP**
- **+5V supply**

*Trademark of the Digital Equipment Corporation

FIFO RAM CONTROLLER (FRC) 8X60

PRODUCT DESCRIPTION

The Signetics 8X60 FIFO RAM Controller (FRC) is an address and status generator designed to implement a high-speed/high-capacity First-In/First-Out (FIFO) stack utilizing standard off-the-shelf RAMs. The FRC can control up to 4096 words of buffer memory; intermediate buffer sizes can be selected—refer to the memory length table on the next page. Built-in arbitration logic handles read/write operations on a first-come/first-served basis.

As shown in Figure 1, the FRC consists of:

- A 12-Bit Write Address Generation Counter (Counter #1) and a 12-Bit Read Address Generation Counter (Counter #2).
- A 12-Bit Up/Down Status Counter (Counter #3).
- Twelve Three-State Address Drivers.
- Control Logic.

The two address counters, #1 and #2, respectively, are used to generate write and read addresses; the outputs of these counters are multiplexed to the three-state address drivers. Counter #3 generates *full, empty,* and *half full* status.

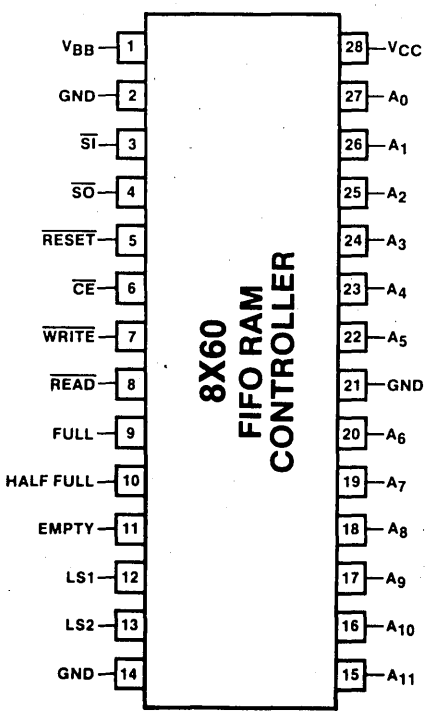
DESIGN FEATURES

- **12-Bit FIFO Address Generator**
- **Data Rate Exceeding 8MHz**
- **Asynchronous Read/Write Operations**
- **Three-State Address Outputs**
- **User-Defined Word Width**
- **Specifically Designed for Use with High-Speed Bipolar RAMs (Adaptable for Use with MOS RAMs)**
- **TTL Input and Output**
- **16mA Address-Drive Capability**

USE AND APPLICATION

- **Interface Between Independently-Clocked Systems**
- **Buffer Memories for Disk and/or Tape**
- **Data Communication Concentrators**
- **CPU/Terminal Buffering**
- **DMA Applications**
- **CRT Terminals**

PACKAGE AND PIN DESIGNATIONS



PIN NO.	IDENTIFIER	FUNCTION
1	V_{BB}	Supply voltage for internal circuits.
2, 14, 21	GND	Circuit ground.
3	$\overline{SI}$	Shift-In request for write cycle; active-low input.
4	$\overline{SO}$	Shift-Out request for read cycle; active-low input.
5	$\overline{RESET}$	Active-low master reset input.
6	$\overline{CE}$	Active-low chip enable input.
7	$\overline{WRITE}$	Write cycle address valid; active-low output.
8	$\overline{READ}$	Read cycle address valid; active-low output.
9	FULL	Memory full status output; also, override input capability. Active when *high*.
10	HALF FULL	Memory half-full status output; active-high.
11	EMPTY	Memory empty status output; also, override input capability. Active when *high*
12	LS1	Least significant bit (LSB) of the memory length select input.
13	LS2	Most significant bit (MSB) of the memory length select input.
15-20 22-27	A_{11}-A_0	Three-state address outputs; A_0 = LSB.
28	V_{CC}	Supply voltage.

© IC MASTER 1983

positive-going edge of $\overline{SO}$ when Counter #3 reaches a count of 127, the HALF FULL output will go from *high*-to-*low*.

- **FULL**—this signal serves both as a status output and as an override input. The FULL signal goes *high* on the negative-going edge of $\overline{SI}$ if all bits of Counter #3 for selected length are equal to "1". The FULL output goes from *high*-to-*low* on the negative-going edge of $\overline{SO}$.
- **EMPTY**—this signal also serves as a status output and as an override input. On the negative-going edge of $\overline{SO}$, the EMPTY output is driven *high* if Status Counter #3 contains a value of "1"; on the positive-going edge of $\overline{SO}$, the counter is decremented to "0". The EMPTY output goes from *high*-to-*low* on the negative-going edge of $\overline{SI}$.

Once the FULL signal is *high*, further Write Cycle Requests ($\overline{SI}$ = low) are ignored; similarly, once the EMPTY signal is *high*, further Read Cycle requests ($\overline{SO}$ = low) are ignored. However, to accommodate diversified applications, the FULL and EMPTY outputs are open-collector with on-chip 4.7K passive pull-up resistors. If either the FULL or EMPTY pins are forced *low* via external control, the corresponding *write* or *read* cycle may resume (provided the external FULL or EMPTY input is held *low* until the corresponding $\overline{WRITE}$ or $\overline{READ}$ output goes *low* and the address/status counters will continue normal operation.

The user must force the $\overline{RESET}$ input *low* to initialize the chip. (*Note.* If the $\overline{RESET}$ signal is driven *low* during a *write* or *read* cycle, the address output may have a short period of uncertainty before assuming a high-impedance state.) The following actions occur when $\overline{RESET}$ is active:

- All internal counters are set to "0".
- All address output lines are forced to the high-impedance state.
- HALF FULL and FULL outputs are forced *low*.
- $\overline{WRITE}$, $\overline{READ}$, and EMPTY outputs are forced high.

When $\overline{CE}$ is *high*, the address output lines are forced to the high-impedance state, further *write* or *read* cycle requests are ignored, and all counters remain unchanged. If $\overline{CE}$ switches from *low*-to-*high* during a *write* or *read* cycle, the cycle in progress is always completed before the disabled state is entered.

SUMMARY OF OPERATION

INPUTS				INITIAL	RESULTING OUTPUTS			
$\overline{RESET}$	$\overline{CE}$	$\overline{SI}$	$\overline{SO}$	CONDITIONS	$\overline{WRITE}$	$\overline{READ}$	ADDRESS BUS	COMMENTS
L	X	X	X		H	H	Hi-Z	Reset all counters to 0.
H	X	H	H		H	H	Hi-Z	No action
H	L	L	H	FULL = L	L	H	Write address from Ctr #1	Shift into FIFO stack (Write Cycle)
H	L	L	H	FULL = H	H	H	Hi-Z	Stack full (Write inhibited)
H	L	H	L	EMPTY = L	H	L	Read address from Ctr #2	Shift out of FIFO stack (Read Cycle)
H	L	H	L	EMPTY = H	H	H	Hi-Z	Stack empty (Read inhibited)
H	L	L	↓	Write cycle in progress	L	H	Write address from Ctr #1	Continue write cycle (until $\overline{SI}$ goes high)
H	L	↓	L	Read cycle in progress	H	L	Read address from Ctr #2	Continue read cycle (until $\overline{SO}$ goes high)
H	L	L	L	EMPTY = H	L	H	Write address from Ctr #1	Shift in (Read inhibited)
H	L	L	L	FULL = H	H	L	Read address from Ctr #2	Shift out (Write inhibited)
H	L	↑	H	Write cycle in progress	↑	H	Goes to Hi-Z	Increment write address counter #1 and status counter #3
H	L	H	↑	Read cycle in progress	H	↑	Goes to Hi-Z	Increment read address counter #2; decrement status counter #3
H	L	↑	L	Write cycle in progress (Note 1)	↑	↓	Changes to read address from Ctr #2	Increment write address counter #1 and status counter #3
H	L	L	↑	Read cycle in progress (Note 2)	↓	↑	Changes to write address from Ctr #1	Increment read address counter #2; decrement status counter #3
H	H	↓	H		H	H	Hi-Z	Chip disabled
H	H	H	↓		H	H	Hi-Z	Chip disabled
H	↑	L	X	FULL = L; write cycle begun (Note 1)	L	H	Write address from Ctr #1	Continue write cycle (until $\overline{SI}$ goes high)
H	↑	X	L	EMPTY = L; read cycle begun (Note 2)	H	L	Read address from Ctr #2	Continue read cycle (until $\overline{SO}$ goes high)
H	↓	L	L	FULL = L; EMPTY = L	—	—	—	This set of conditions should be avoided

Notes:
1. Write cycle will occur if either $\overline{SI}$ goes *low* before $\overline{SO}$ goes *low* or EMPTY = H when $\overline{SO}$ goes *low*.
2. Read cycle will occur if either $\overline{SO}$ goes *low* before $\overline{SI}$ goes *low* or FULL = H when $\overline{SI}$ goes

FIFO RAM CONTROLLER (FRC) 8X60

BLOCK DIAGRAM

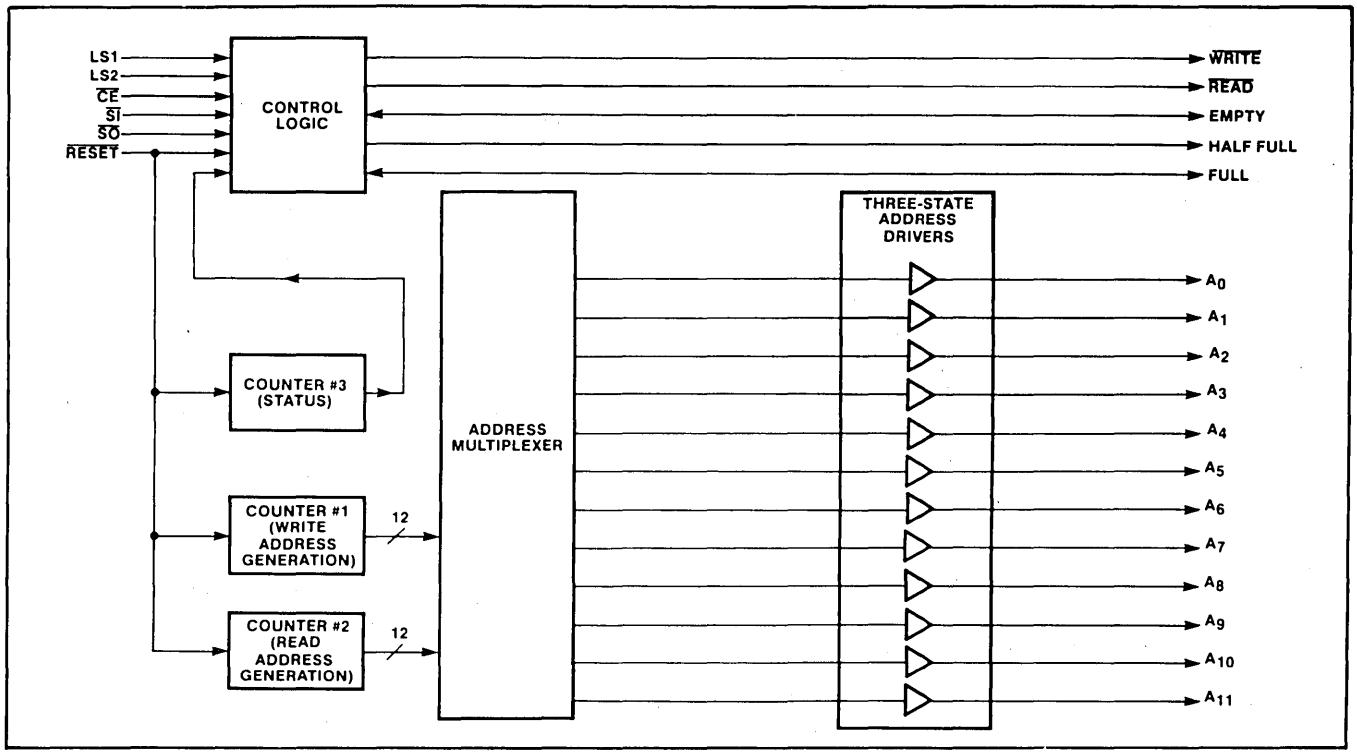

Figure 1. Functional Block Diagram of FIFO RAM Controller

FUNCTIONAL OPERATION

The FRC operates in either of two basic modes—*write* into the FIFO buffer memory or *read* from the FIFO buffer memory. These two operations are described in subsequent paragraphs and the complete sequence is summarized on the next page.

FIFO BUFFER MEMORY—WRITE CYCLE

To perform a write operation, $\overline{SO}$ must be *high* and SI must be *low*. When these conditions exist and other control parameters are satisfied, the write address in Counter #1 is output to the address bus via the multiplexer and the $\overline{WRITE}$ output goes *low*. (*Note.* Normally, the $\overline{WRITE}$ output goes *low* after the address output becomes stable. The $\overline{WRITE}$ output may then act as a *write* or *chip* enable for the RAMs that are used to implement the memory.)

When the *write* cycle is ended ($\overline{SI}$ is forced high), the $\overline{WRITE}$ output goes *high*, the address output buffers return to a high-impedance state, Counter #1 (Write Address Generation) and Counter #3 (Status) are both incremented, and Counter #2 (Read Address Generation) remains unchanged.

FIFO BUFFER MEMORY—READ CYCLE

To perform a read operation, $\overline{SI}$ must be *high* and $\overline{SO}$ must be *low*. When these conditions exist and other control parameters are satisfied, the read address contained in Counter #2 is output to the address bus and the $\overline{READ}$ output goes *low*.

When the *read* cycle is ended ($\overline{SO}$ is forced *high*), the $\overline{READ}$ output goes *high*, the output buffers return to a high-impedance state, Counter #2 (Read Address Generation) is incremented, Counter #3 (Status) is decremented, and Counter #1 (Write Address Generation) remains unchanged.

CONTROL LOGIC

To prevent the possibility of operational conflicts, $\overline{SI}$ and $\overline{SO}$ are treated on a first-come/first-served basis; these two input signals are controlled by internal arbitration logic. If one cycle is requested while the other cycle is in progress, the requested cycle will commence as soon as the current cycle is complete (provided other control parameters are satisfied).

As shown in the accompanying diagram, the buffer length of the FIFO memory can be hardware-selected via the Length Select (LS1.LS2) inputs. When less than the maximum length is selected, the unused high-order bits of the address outputs are held in the high-impedance state.

MEMORY LENGTH

LSI	LS2	HALF LENGTH	FULL LENGTH
L	L	2048	4096
H	L	32	64
L	H	512	1024
H	H	128	256

Generation of the status output signals (HALF FULL, FULL, and EMPTY) is a function of the Length Select (LS1, LS2) inputs and the current state of Status Counter #3. In general, the status outputs reflect the conditions that follow:

- **HALF FULL**—this status output signal goes *high* on the positive-going edge of $\overline{SI}$ if the MSB of the selected length of Counter #3 becomes a "1". The HALF FULL signal will go from *high*-to-*low* on the positive-going edge of $\overline{SO}$ when, after the *read* cycle, the selected length of Counter #3 changes from "100...00" to "011...11". For example, if the selected memory length is 256 words (FULL = 256), then HALF FULL = 128 words; hence, on the

PROGRAMMABLE COMMUNICATIONS INTERFACE (PCI) SCN2651

DESCRIPTION

The Signetics 2651 PCI is a universal synchronous/asychronous data communications controller chip designed for microcomputer systems. It interfaces directly to the Signetics 2650 microprocessor and may be used in a polled or interrupt driven system environment. The 2651 accepts programmed instructions from the microprocessor and supports many serial data communication disciplines, synchronous and asynchronous, in the full or half-duplex mode.

The PCI serializes parallel data characters received from the microprocessor for transmission. Simultaneously, it can receive serial data and convert it into parallel data characters for input to the microcomputer.

The 2651 contains a baud rate generator which can be programmed to either accept an external clock or to generate internal transmit or receive clocks. Sixteen different baud rates can be selected under program control when operating in the internal clock mode.

The PCI is constructed using Signetics n-channel silicon gate depletion load technology and is packaged in a 28-pin DIP.

FEATURES

- Synchronous operation
  - 5 to 8-bit characters
  - Single or double SYN operation
  - Internal character synchronization
  - Transparent or non-transparent mode
  - Automatic SYN or DLE-SYN insertion
  - SYN or DLE stripping
  - Odd, even, or no parity
  - Local or remote maintenance loop back mode
  - Baud rate: dc to 1M bps (1X clock)
- Asynchronous operation
  - 5 to 8-bit characters
  - 1, 1 1/2 or 2 stop bits
  - Odd, even, or no parity
  - Parity, overrun and framing error detection
  - Line break detection and generation
  - False start bit detection
  - Automatic serial echo mode
  - Local or remote maintenance loop back mode
  - Baud rate: dc to 1M bps (1X clock)
    dc to 62.5K bps (16X clock)
    dc to 15.625K bps (64X clock)

FEATURES

- Internal or external baud rate clock
- 16 internal rates-50 to 19,200 baud
- Double buffered transmitter and receiver
- Full or half duplex operation
- Fully compatible with 2650 CPU
- TTL compatible inputs and outputs
- Single 5V power supply
- No system clock required
- 28-pin dual in-line package

APPLICATIONS

- Intelligent terminals
- Network processors
- Front end processors
- Remote data concentrators
- Computer to computer links
- Serial peripherals

MICROPROCESSOR DIVISION

MULTI-PROTOCOL COMMUNICATIONS CONTROLLER SCN2652/68652

DESCRIPTION

The 2652 Multi-Protocol Communications Controller (MPCC) is a monolithic n-channel MOS LSI circuit that formats, transmits and receives synchronous serial data while supporting bit-oriented or byte control protocols. The chip is TTL compatible, operates from a single +5V supply, and can interface to a processor with an 8 or 16-bit bidirectional data bus.

FEATURES

- DC to 1Mbps data rate, 2652-1 to 2Mbps
- Bit-oriented protocols (BOP): SDLC, ADCCP, HDLC
- Byte-control protocols (BCP): DDCMP, BISYNC (external CRC)
- Programmable operation
  - 8 or 16-bit tri-state data bus
  - Error control—CRC or VRC or none
  - Character length—1 to 8 bits for BOP or 5 to 8 bits for BCP
  - SYNC or secondary station address comparison for BCP-BOP
  - Idle transmission of SYNC/FLAG or MARK for BCP-BOP
- Automatic detection and generation of special BOP control sequences, i.e., FLAG, ABORT, GA
- Zero insertion and deletion for BOP
- Short character detection for last BOP data character
- SYNC generation, detection, and stripping for BCP
- Maintenance Mode for self-testing
- TTL compatible
- Single +5V supply

APPLICATIONS

- Intelligent terminals
- Line controllers
- Network processors
- Front end communications
- Remote data concentrators
- Communication test equipment
- Computer to computer links

MICROPROCESSOR DIVISION

POLYNOMIAL GENERATOR CHECKER SCN2653/68653

DESCRIPTION

The Signetics 2653 Polynomial Generator Checker (PGC) is a polynomial generator checker/character comparator circuit that complements a receiver/transmitter (R/T or USART/USRT/UART) in the support of character oriented data link controls. Table 1 defines many of the more commonly used PGC terms and abbreviations.

Parallel data characters transferred between the CPU and R/T are monitored by the PGC which performs block check character (BCC) and parity (VRC) generation/checking, single character detection, and two character sequence detection. Since the PGC operates on parallel characters, the data transmission format may be serial (synchronous or asynchronous) or parallel.

There are four modes of BCC accumulation and each mode can select one of three polynomials to compute the BCC. In the BISYNC normal and transparent modes, the PGC determines which characters are to be accumulated and which characters are to be excluded from the accumulation. The block terminating characters and the initiation and termination of BISYNC transparent text can be detected and an interrupt generated. The single interrupt output represents the inclusive OR of four maskable status conditions.

In the automatic accumulation mode, all characters are accumulated while the single accumulate mode requires a specific accumulation command for each character to be accumulated.

Character accumulation control and character comparisons are facilitated by a character class array which places each of 128 characters into one of four character classes. The four classes are normal, SYN/BISYNC not included, block terminating character (BTC)/search character (SC), and secondary search character (SSC).

Additional PGC applications include off-line R/T operation where the BCC is generated on data not sent to the R/T, BCC multiplexing by sharing the PGC among several R/Ts and reading/writing the partial BCC accumulation on a character by character basis, VRC generation/checking on characters appearing on a bidirectional data bus, and programmable character comparisons or searches.

PGC operation is half duplex (either receive or transmit, one way or two way alternate). Full duplex (two way simultaneous) is achieved by using two PGCs. The device is directly compatible with the Signetics 2651 Programmable Communications Interface (PCI) and 2661 Enhanced Programmable Communications Interface (EPCI). When used in BISYNC modes with the 2661, software requirements are minimized by the 2653-2661 control character comparisons, character sequence comparisons, and automatic DLE insertion/detection.

Other bus oriented R/Ts can be interfaced to the PGC with a minimum of external circuitry. See figure 1 for a typical system configuration.

This NMOS LSI circuit is TTL compatible, operates from a single + 5V supply and is contained in a 16 pin dual in line package.

FEATURES

- Parallel Block Check Character accumulation/checking: CRC-16, CRC-12, LRC-8
- BISYNC normal and transparent modes
- Automatic or single character accumulation modes
- Character detection - up to 128 characters
- Two character sequence detection; examples: DLE-STX, ACK 0, ACK 1, WACK, RVI, DISC, WBT
- 6, 7, or 8-bit characters
- VRC generation/checking on data bus
- Four maskable interrupt conditions
- Four classes of characters
- Internal power-on reset
- Maximum character accumulation rate of 500 kHz (4 Mbps)
- Directly compatible with Signetics 2651, 2652 and 2661
- No system clock required
- TTL compatible inputs and outputs
- Single 5V supply
- 16-pin dual in line package

APPLICATIONS

- Character oriented data link control:
  - -dedicated to one USART/USRT
  - -multiplexed among several USART/USRTs
- Automated BISYNC with 2661 (minimal software intervention)
- BCC and VRC generation/detection on a block of memory or peripheral data
- Programmable character array comparator

BLOCK DIAGRAM

The PGC consists of six major sections. These are the operation control, character class array, DLE ROM, character register, BCC and parity generators, and BCC registers. These sections communicate with each other via an internal data bus and an internal control bus. The internal data bus interfaces to the CPU data bus via a data bus buffer.

ENHANCED PROGRAMMABLE COMMUNICATIONS INTERFACE SCN2661/68661

PRODUCT BRIEF, contact your Signetics sales offices for complete information.

DESCRIPTION

The Signetics 2661 EPCI is a universal synchronous/asynchronous data communications controller chip that is an enhanced pin compatible version of the 2651. It interfaces directly to most 8-bit microprocessors and may be used in a polled or interrupt driven system environment. The 2661 accepts programmed instructions from the microprocessor while supporting many serial data communications disciplines—synchronous and asynchronous—in the full or half-duplex mode. Special support for BISYNC is provided.

The EPCI serializes parallel data characters received from the microprocessor for transmission. Simultaneously, it can receive serial data and convert it into parallel data characters for input to the microcomputer.

The 2661 contains a baud rate generator which can be programmed to either accept an external clock or to generate internal transmit or receive clocks. Sixteen different baud rates can be selected under program control when operating in the internal clock mode. Each version of the EPCI (A, B, C) has a different set of baud rates.

The EPCI is constructed using Signetics n-channel silicon gate depletion load technology and is packaged in a 28-pin DIP.

FEATURES

- **Synchronous operation**
  - **5 to 8-bit characters plus parity**
  - **Single or double SYN operation**
  - **Internal or external character synchronization**
  - **Transparent or non-transparent mode**
  - **Transparent mode DLE stuffing (Tx) and detection (Rx)**
  - **Automatic SYN or DLE-SYN insertion**
  - **SYN, DLE and DLE-SYN stripping**
  - **Odd, even, or no parity**
  - **Local or remote maintenance loop back mode**
  - **Baud rate: dc to 1M bps (1X clock)**
- **Asynchronous operation**
  - **5 to 8-bit characters plus parity**
  - **1, 1½ or 2 stop bits transmitted**
  - **Odd, even, or no parity**
  - **Parity, overrun and framing error detection**
  - **Line break detection and generation**
  - **False start bit detection**
  - **Automatic serial echo mode (echoplex)**
  - **Local or remote maintenance loop back mode**
  - **Baud rate: dc to 1M bps (1X clock)**
    dc to 62.5K bps (16X clock)
    dc to 15.625K bps (64X clock)

OTHER FEATURES

- **Internal or external baud rate clock**
- **3 baud rate sets**
- **16 internal rates for each set**
- **Double buffered transmitter and receiver**
- **Dynamic character length switching**
- **Full or half duplex operation**
- **Fully compatible with 2650 CPU**
- **TTL compatible inputs and outputs**
- **RxC and TxC pins are short circuit protected**
- **3 open drain MOS outputs can be wire-ORed**
- **Single 5V power supply**
- **No system clock required**
- **24- and 28-pin versions**

APPLICATIONS

- **Intelligent terminals**
- **Network processors**
- **Front end processors**
- **Remote data concentrators**
- **Computer to computer links**
- **Serial peripherals**
- **BISYNC adaptors**

MICROPROCESSOR DIVISION

DUAL ASYNCHRONOUS RECEIVER/TRANSMITTER (DUART) SCN2681 SERIES

DESCRIPTION

The Signetics SCN2681 Dual Universal Asynchronous Receiver/Transmitter (DUART) is a single chip MOS-LSI communications device that provides two independent full-duplex asynchronous receiver/transmitter channels in a single package. It interfaces directly with microprocessors and may be used in a polled or interrupt driven system.

The operating mode and data format of each channel can be programmed independently. Additionally, each receiver and transmitter can select its operating speed as one of eighteen fixed baud rates, a 16x clock derived from a programmable counter/timer, or an external 1x or 16x clock. The baud rate generator and counter/timer can operate directly from a crystal or from external clock inputs. The ability to independently program the operating speed of the receiver and transmitter make the DUART particularly attractive for dual-speed channel applications such as clustered terminal systems.

Each receiver is quadruply buffered to minimize the potential of receiver overrun or to reduce interrupt overhead in interrupt driven systems. In addition, a flow control capability is provided to disable a remote DUART transmitter when the buffer of the receiving device is full.

Also provided on the SCN2681 are a multipurpose 7-bit input port and a multipurpose 8-bit output port. These can be used as general purpose I/O ports or can be assigned specific functions (such as clock inputs or status/interrupt outputs) under program control.

The SCN2681 is available in three package versions to satisfy various system requirements: 40-pin and 28-pin, both 0.6″ wide DIPs, and a compact 24-pin, 0.4″ wide, DIP.

FEATURES

- **Dual full-duplex asynchronous receiver/transmiter**
- **Quadruple buffered receiver data registers**
- **Programmable data format**
  - **—5 to 8 data bits plus parity**
  - **—Odd, even, no parity or force parity**
  - **—1, 1.5 or 2 stop bits programmable in 1/16 bit increments**
- **Programmable baud rate for each receiver and transmiter selectable from:**
  - **—18 fixed rates: 50 to 38.4K baud**
  - **—One user defined rate derived from programmable timer/counter**
  - **—External 1x or 16x clock**
- **Parity, framing, and overrun error detection**
- **False start bit detection**
- **Line break detection and generation**
- **Programmable channel mode**
  - **—Normal (full duplex)**
  - **—Automatic echo**
  - **—Local loopback**
  - **—Remote loopback**
- **Multi-function programmable 16-bit counter/timer**
- **Multi-function 7-bit input port**
  - **—Can serve as clock or control inputs**
  - **—Change of state detection on four inputs**
- **Multi-function 8-bit output port**
  - **—Individual bit set/reset capability**
  - **—Outputs can be programmed to be status/interrupt signals**
- **Versatile interrupt system**
  - **—Single interrupt output with eight maskable interrupting conditions**
  - **—Output port can be configured to provide a total of up to six separate wire-OR'able interrupt outputs**
- **Maximum data transfer: 1X — 1MB/sec, 16X — 125KB/sec**
- **Automatic wake-up mode for multidrop applications**
- **Start-end break interrupt/status**
- **Detects break which originates in the middle of a character**
- **On-chip crystal oscillator**
- **TTL compatible**
- **Single +5V power supply**

MICROPROCESSOR DIVISION

DISPLAY CHARACTER AND GRAPHICS GENERATOR (DCGG) SCN2670

DESCRIPTION

The Signetics Display Character and Graphics Generator (DCGG) is a mask-programmable 11,648-bit line select character generator. It contains 128 10X9 characters placed in a 10X16 matrix, and has the capability of shifting certain characters, such as j, y, g, p and q, that normally extend below the baseline. Character shifting, previously requiring additional external circuitry, is now accomplished internally by the DCGG; effectively, the 9 active lines are lowered within the matrix to compensate for the character's position.

Seven bits of an 8-bit address code are used to select 1 of the 128 available characters. The eighth bit functions as a chip enable signal. Each character is defined by a pattern of logic 1s and 0s stored in a 10X9 matrix. When a specific 4-bit binary line address code is applied, a word of 10 parallel bits appears at the output. The lines can be sequentially selected, providing a 9-word sequence of 10 parallel bits per word for each character selected by the address inputs. As the line address inputs are sequentially addressed, the device will automatically place the 10X9 character in 1 of 2 preprogrammed positions on the 16-line matrix with the positions defined by the 4-line address inputs. One or more of the 10 parallel outputs can be used as control signals to selectively enable functions such as half-dot shift, color selection, etc.

The 2670 DCGG includes latches to store the character address and line address data. A control input to inhibit character data output for certain groups of characters is also provided. The 2670 also includes a graphics capability, wherein the 8-bit character code is translated directly into 256 possible user programmable graphic patterns. Thus, the DCGG can generate data for 384 distinct patterns, of which 128 are defined by the mask programmable ROM. See figure 1 for a typical applications display.

FEATURES

- 128 10X9 matrix characters
- 256 graphic characters
- Optional thin graphics for forms
- Character and line address latches
- Internal descend logic
- 200nsec and 300nsec character select access time versions
- Control character output inhibit logic
- Static operation—no clocks required
- Single 5V power supply
- TTL compatible inputs and outputs

© IC MASTER 1983

PROGRAMMABLE KEYBOARD & COMM CONTROLLER (PKCC) SCN2671

DESCRIPTION

The Signetics 2671 Programmable Keyboard and Communications Controller (PKCC) is an MOS LSI device which provides a versatile keyboard encoder and an independent full duplex asynchronous communications controller. It is intended for use in microprocessor based systems and provides an eight bit data bus interface.

The keyboard encoder handles the scanning, debounce, and encoding of a keyboard matrix with a maximum of 128 keys. It provides four levels of key encoding corresponding to the separate SHIFT and CONTROL input combinations. Four keyboard rollover modes can be programmed including provisions for up to 16 latched keys. Control outputs are provided for interfacing with contact or capacitive keyboards. An eight bit keyboard status register provides status information to the CPU.

The receiver section of the communications controller accepts serial data from the RxD pin and converts it to parallel data characters. Simultaneously, the transmitter section accepts parallel data from the data bus and outputs serialized data onto the TxD pin. Received data is checked for parity and framing errors, and break conditions are flagged. Character lengths can be programmed as 5, 6, 7, or 8 bits not including parity, start or stop bits. An internal baud rate generator (BRG) with 16 divider ratios can be used to derive the receive and/or transmit clocks. The BRG can accept an external clock or operate directly from a crystal. An eight bit communications status register provides status information to the CPU.

The PKCC has an interrupt mask register to selectively enable certain keyboard and communications status bits to generate interrupts. Priority encoded interrupt vectoring is available. Upon receipt of an interrupt acknowledge, an interrupt vector will be output on D0-D7 reflecting the source of the interrupt. The interrupt source can also be read from an interrupt status register.

FEATURES

- **Keyboard interface**
  - **Contact or capacitive keyboard**
  - **Up to 128 keys on an 8 X 16 matrix**
  - **Encoded or unencoded operation**
  - **Four code levels per key**
  - **Latched key option—separate depress and release codes**
  - **Programmable scan rate and debounce time**
  - **Programmable rollover modes**
  - **Programmable auto-repeat for selected keys**
  - **Tone output—two frequencies**
- **Asynchronous communication interface**
  - **Internal baud rate generator—16 rates**
  - **Full duplex operation**
  - **Detection of start and end of break**
  - **Programmable break generation**
  - **Programmable character parameters**
  - **Auto-echo and maintenance loopback modes**
- **Polled or interrupt operation**
- **Interrupt priority controller and vector generator**
- **Operates directly from crystal or external clocks**
- **TTL compatible**
- **Single +5 volt power supply**
- **40 pin dual in-line package**

APPLICATIONS

- **CRT terminals**
- **Hard copy terminals**
- **Word processing systems**
- **Data entry terminals**
- **Small business computers**

FUNCTIONAL DESCRIPTION

The PKCC consists of six major sections (see block diagram). These are the transmitter, receiver, timing, operation control, keyboard encoder, and a priority encoded interrupt control unit. These sections communicate with each other via an internal data bus and an internal control bus. The internal data bus interfaces to the microprocessor data bus via a bidirectional data bus buffer.

Operation Control

This functional block stores configuration and operation commands from the CPU and generates appropriate signals to various internal sections to control the overall device operation. It contains read and write circuits to permit communications with the microprocessor via the data bus and contains mode registers KMR and CMR, the command decoder, and status registers KSR and CSR. Details of operating modes and status information are presented in the Operation section of this data sheet. The register addressing is specified in table 1.

Timing

The PKCC contains a baud rate generator (BRG) which is programmable to accept external transmit or receive clocks or to divide an external clock to perform data communications. The unit can generate 16 baud rates, any of which can be selected for full duplex operation. The external clock to the baud rate generator can be applied directly to the XTAL2 input (see figure 21) or can be generated internally by connecting a crystal across the XTAL1, XTAL2 input pins. The clock input is also utilized by the keyboard encoder section. Thus, a clock must be provided even if external transmitter and receiver clocks are used.

MICROPROCESSOR DIVISION

PROGRAMMABLE VIDEO TIMING CONTROLLER (PVTC) SCN2672

DESCRIPTION

The Signetics 2672 Programmable Video Timing Controller (PVTC) is a programmable device designed for use in CRT terminals and display systems that employ raster scan techniques. The PVTC generates the vertical and horizontal timing signals necessary for the display of interlaced or non-interlaced data on a CRT monitor. It provides consecutive addressing to a user specified display buffer memory domain and controls the CPU-display buffer interface for various buffer configuration modes. A variety of operating modes, display formats, and timing profiles can be implemented by programming the control registers in the PVTC.

A minimum CRT terminal system configuration consists of a PVTC, a 2671 Keyboard and Communication Controller (PKCC), a 2670 Display Character and Graphics Generator (DCGG), a 2673 Video and Attributes Controller (VAC), a single chip microcomputer such as the 8048, a display buffer RAM, and a small amount of TTL for miscellaneous address decoding, interface, and control. Typically, the package count for a minimum system is between 15 and 20 devices; system complexity can be enhanced by upgrading the microprocessor and expanding via the system address and data busses.

FEATURES

- **4MHz character rate**
- **Up to 256 characters per row**
- **1 to 16 raster lines per character row**
- **Up to 128 character rows per frame**
- **Programmable horizontal and vertical sync generators**
- **Interlaced or non-interlaced operation**
- **Up to 16K RAM addressing for multiple page operation**
- **Automatic wraparound of RAM**
- **Addressable incrementable and readable cursor**
- **Programmable cursor size, position, and blink**
- **Split screen and horizontal scroll capability**
- **Light pen register**
- **Selectable buffer interface modes**
- **Dynamic RAM refresh**
- **Completely TTL compatible**
- **Single +5 volt power supply**
- **Power on reset circuit**

APPLICATIONS

- **CRT terminals**
- **Word processing systems**
- **Small business computers**
- **Home Computers**

MICROPROCESSOR DIVISION

VIDEO ATTRIBUTES CONTROLLER (VAC) SCN2673

DESCRIPTION

The Signetics 2673A and 2673B Video Attributes Controllers (VAC) are bipolar LSI devices designed for CRT terminals and display systems that employ raster scan techniques. Each contains a high speed video shift register, field and character attributes logic, attribute latch, cursor format logic and half dot shift control.

The VAC provides control of visual attributes on a field or character by character. Internal logic preserves field attribute data from character row to character row so that an attribute byte is not required at the beginning of each row. The 2673B provides for reverse video, blank (non-display), blink, underline and highlight attributes and a graphics mode attribute to work in conjunction with the Signetics 2670 Display Character and Graphics Generator (DCGG). The 2673A substitutes a light pen (strike-thru) attribute for the graphics attribute.

The horizontal dot frequency is the basic timing input to the VAC. Internally, this clock is divided down to provide a character clock output for system synchronization. Up to ten bits of video dot data are parallel loaded into the video shift register on each character boundary. The video data is shifted out on three outputs at the dot frequency. On the VIDEO output, the data is presented as a three level signal representing low, medium and high intensities. The three intensities are also encoded on two TTL compatible video outputs. Light or dark screen background can be selected.

FEATURES

- **25MHz video dot rate**
- **Three level current driven (75 ohms) video output**
- **Three level encoded TTL video outputs**
- **Character/field attribute logic**
  - **Reverse video**
  - **Character blank**
  - **Character blink**
  - **Underline**
  - **Highlight**
  - **Light pen strike-thru or graphics control**
- **Field attributes extend from row to row**
- **Light or dark field**
- **Cursor reverse video logic**
- **Up to 10 dots per character**
- **Composite blanking for light field retrace**
- **Optional field graphics control output**
- **High speed bipolar design**
- **40 pin dual in-line package**
- **TTL compatible**
- **Compatible with Signetics 2672 PVTC and 2670 DCGG**

APPLICATIONS

- **CRT terminals**
- **Word processing systems**
- **Small business computers**

ADVANCED VIDEO DISPLAY CONTROLLER (AVDC) SCN2674

DESCRIPTION

The Signetics SCN2674 Advanced Video Display Controller (AVDC) is a programmable device designed for use in CRT terminals and display systems that employ raster scan techniques. The AVDC generates the vertical and horizontal timing signals necessary for the display of interlaced or non-interlaced data on a CRT monitor. It provides consecutive addressing to a user specified display buffer memory domain and controls the CPU-display buffer interface for various buffer configuration modes. A variety of operating modes, display formats, and timing profiles can be implemented by programming the control registers in the AVDC.

A minimum CRT terminal system configuration consists of an AVDC, an SCN2671 Keyboard and Communication Controller (PKCC), an SCN2670 Display Character and Graphics Generator (DCGG), an SCN2675 Color/Monochrome Attributes Controller (CMAC), a single chip microcomputer such as the 8048, a display buffer RAM, and a small amount of TTL for miscellaneous address decoding, interface, and control. Typically, the package count for a minimum system is between 15 and 20 devices; system complexity can be enhanced by upgrading the microprocessor and expanding via the system address and data busses.

FEATURES

- 4MHz character rate
- 1 to 256 characters per row
- 1 to 16 raster lines per character row
- 1 to 128 character rows per frame
- Bit mapped graphics mode
- Programmable horizontal and vertical sync generators
  - RS170 compatible sync
- Interlaced or non-interlaced operation
- Up to 16K RAM addressing for multiple page operation
- Readable, writable and incrementable cursor
  - Programmable cursor size and blink
- AC line lock
- Automatic wraparound of RAM
- Automatic split screen
- Automatic bidirectional soft scrolling
  - Programmable scan line increment
- Double height tops and bottoms
- Double width control output
- Selectable buffer interface modes
- Dynamic RAM refresh
- Completely TTL compatible
- Single +5 volt power supply
- Power on reset circuit

APPLICATIONS

- CRT terminals
- Word processing systems
- Small business computers
- Home computers

MICROPROCESSOR DIVISION

COLOR/MONOCHROME ATTRIBUTES CONTROLLER (CMAC) SCB2675

DESCRIPTION

The Signetics SCB2675 Color/Monochrome Attributes Controller (CMAC) is a bipolar LSI device designed for CRT terminals and display systems that employ raster scan techniques. It contains a programmable dot clock divider to generate a character clock, a high speed shift register to serialize input dot data into a video stream, latches and logic to apply visual attributes to the resulting display, and logic to display a cursor on the display.

The CMAC provides control of visual attributes on a character by character basis for two operating modes: monochrome and color. The monochrome mode provides reverse video, blank, highlight and two general purpose user definable attributes. In this mode, the display characters can be specified to appear on either a light or dark screen background. Retrace video suppression can be automatically or externally controlled. The color mode provides eight colors for foreground (character) video and eight colors for background video together with a luminance output for external color set selection or to simultaneously drive a monochrome monitor. Additionally, both modes provide double width, underline, blink, dot stretching and dot width attributes. In monochrome mode, the SCB2675 emulates the attribute characteristics of Digital Equipment Corporation's VT100 terminal.

The horizontal dot frequency is the basic timing input to the CMAC. This clock is divided internally to provide a character clock output for system synchronization. Up to ten bits of dot data are parallel loaded into the video shift register on each character boundary. The two TTL video data outputs in monochrome mode are encoded to provide four video intensities (black, gray, white and highlight). The video data in color mode is encoded to provide eight foreground colors and shifted out on three TTL outputs, together with the luminance output.

FEATURES

- 30 and 18MHz video dot rate versions
- Four video intensities encoded on two TTL outputs (monochrome mode)
- Eight foreground and background colors encoded on three TTL outputs (color mode)
- Internally latched character attributes:
  - Reverse video
  - Blank
  - Blink
  - Underline
  - Highlight
  - Two general purpose
  - Eight foreground colors
  - Eight background colors
  - Dot width control
  - Double width characters
- VT100 compatible attributes
- Reverse video cursor with optional white cursor in color mode
- Up to 10 dots per character
- Light or dark background in monochrome mode
  - Automatic retrace blanking
- Programmable dot stretching
- Compatible with SCN2674 AVDC and SCN2670 DCGG
- TTL compatible
- 40-pin dual in-line package

APPLICATIONS

- CRT terminals
- Word processing systems
- Small business computers

MICROPROCESSOR DIVISION

SINGLE CHIP 8-BIT MICROCOMPUTERS SCN80 SERIES

DESCRIPTION

The Signetics SCN80 Series microcomputers are self-contained, 8-bit processors which contain the system timing, control logic, RAM data memory, ROM program memory (8048/49/50 only), and I/O lines necessary to implement dedicated control functions. All SCN80 Series devices are pin and program compatible, differing only in the size of the on-board program ROM and data RAM, as follows:

TYPE	RAM SIZE	ROM SIZE
8048	64 x 8	1K x 8
8049	128 x 8	2K x 8
8050	256 x 8	4K x 8
8035	64 x 8	—
8039	128 x 8	—
8040	256 x 8	—

Program memory can be expanded externally up to a maximum total of 4K bytes without paging. Data memory can also be expanded externally. I/O capabilities can be expanded using standard devices or the 8243 I/O expander.

The SCN80 Series processors are designed to be efficient control processors as well as arithmetic processors. They provide an instruction set which allows the user to directly set and reset individual lines within its I/O ports as well as test individual bits within the accumulator. A large variety of branch and table look-up instructions make these processors very efficient in implementing standard logic functions. Also, special attention has been given to code efficiency. Over 70% of the instructions are a single byte long and all others are only 2 bytes long.

An on-chip 8-bit counter is provided which can count, under program control, either internal clock pulses (with a divide by 32 prescaler) or external events. The counter can be programmed to cause an interrupt on terminal count.

FEATURES

- 8-bit CPU, ROM, RAM, I/O in a 40-pin package
- 24 quasi bidirectional I/O lines
- Two test inputs
- Internal counter/timer
- Single-level vectored interrupts: external, counter/timer
- Over 90 instructions, 70% single byte
- 1.36μs or 2.5μs instruction cycle, all instructions one or two cycles
- Expandable memory and I/O
- Low voltage standby
- TTL compatible inputs and outputs
- Single +5V power supply

16-BIT MICROPROCESSOR SCN68000

PRODUCT BRIEF, contact your Signetics sales offices for complete information.

DESCRIPTION

Advances in semiconductor technology have provided the capability to place on a single chip a microprocessor at least an order of magnitude higher in performance and circuit complexity than has been previously available. The SCN68000 is the first of a family of such VLSI microprocessors from Signetics. It combines state-of-the-art technology and advanced circuit design techniques with computer sciences to achieve an architecturally advanced 16-bit microprocessing unit. The SCN68000 offers seventeen 32-bit registers in addition to the 32-bit program counter and a 16-bit status register (see the programming model in figure 1). The first eight registers (D0-D7) are used as data registers for byte (8-bit), word (16-bit), and long word (32-bit) data operations. The second set of seven registers (A0-A6) and the system stack pointer can be used as software stack pointers and base address registers. In addition, these registers can be used for word and long word address operations. All 17 registers can be used as index registers.

FEATURES

- 32-bit data and address registers
- 16-megabyte direct addressing range
- 56 powerful instruction types
- Operations on five main data types
- Memory mapped I/O
- 14 addressing modes

MICROPROCESSOR DIVISION

INTELLIGENT PERIPHERAL CONTROLLER SCN68120

DESCRIPTION

The SCN68120 Intelligent Peripheral Controller (IPC) is a general-purpose, user-programmable peripheral controller. It contains a system interface, an 8-bit CPU, a serial communications interface, 21 parallel I/O lines, a 16-bit timer, 2048 bytes of ROM, and eight operating modes. In addition, the SCN68120 features 128 bytes of dual-ported RAM and six semaphore registers that are accessible to both the internal CPU and an external processor or device through the system interface. The SCN68120 provides all the control signals necessary to interface with the asynchronous bus of the SCN68000.

FEATURES

- Bus compatible with the 16-bit SCN68000 and with 8-bit microprocessors
- Bus compatible with 8-bit peripherals
- TTL compatible I/O
- 8-bit CPU
- 2K bytes ROM
- 128 bytes dual-ported RAM
- Six shared semaphore registers
- 16-bit timer
- 21 parallel I/O and two handshake lines
- Serial communications interface
- Interrupt capability
- Operates in single-chip mode or expandable to 64K-byte addressing range
- DMA capability
- 8 x 8-bit multiply

MICROPROCESSOR DIVISION

PARALLEL INTERFACE/TIMER SCN68230

DESCRIPTION

The SCN68230 Parallel Interface/Timer (PI/T) is a general-purpose, programmable parallel interface device which meets most system parallel I/O and timing needs. The parallel interfaces of the PI/T may be used to connect a wide variety of peripheral devices to the SCN68000 bus. The PI/T can be programmed to generate interrupt requests to the SCN68000, or DMA requests to direct memory access controllers on demand of the peripheral. No external logic is needed to connect the PI/T to the DMAC or to the SCN68000. The PI/T also provides complete port and timer status information.

The SCN68230 contains two multi-mode, double-buffered I/O ports (Port A and Port B), a third 8-bit I/O port, and a 24-bit programmable timer. The PI/T also contains flexible prioritization logic for generating unique interrupt vectors. Autovectored interrupts are also supported. Port C pins provide either another port pin or special functions consisting of interrupt, timer, or direct memory access control lines.

FEATURES

- 24 programmable I/O lines
- Port modes include:
  - Bit mode
  - Unidirectional 8-bit mode
  - Unidirectional 16-bit mode
  - Bidirectional 8-bit mode
  - Bidirectional 16-bit mode
- Selectable handshaking modes
- 24-bit programmable timer
- Several timer modes
- Contains interrupt prioritization logic
- Unique interrupt vectors for each source
- Supports interrupt and DMA service requests
- Contains port and timer status registers
- SCN68000 bus compatible

© IC MASTER 1983

DIRECT MEMORY ACCESS INTERFACE (DMAI) SCB68430

PRODUCT BRIEF, contact your Signetics sales office for complete information.

DESCRIPTION

The SCB68430 DMAI is a single channel DMA interface circuit which is intended to complement the performance and architectural capabilities of the SCN68000 microprocessor. The DMAI functions by transferring a series of operands (data) between memory and a device: operand sizes may be byte, word, or long word. A block is a sequence of operands: the number of operands in the block is determined by a transfer count stored within the DMAI. The SCB68430 can be programmed to utilize single cycle (cycle stealing) or burst data transfers.

The DMAI provides two interfaces. The microprocessor interface is fully compatible with the SCN68000 microprocessor. The device interface includes lines for requesting, acknowledging, controlling, and timing the data transfers.

The DMAI is a single-channel subset of other 68000 family DMA controllers. It is software compatible with the other devices and provides similar interfacing signals to both the system bus and the device.

The SCB68430 is constructed using Signetics ISL bipolar technology and is contained in a 48-pin dual-in-line package.

FEATURES

- Single channel DMA controller
- Bus compatible with SCN68000 microprocessor
- Software compatible with 68000 family DMA controllers
- Single address transfers
- Cycle steal and burst mode operation
- Bus arbitration daisy chain
- Automatic rerun on bus error
- Supports SCN68000 vectored interrupts
- Supports 32 bit transfers on VME bus
- 24-bit address register
- 16-bit transfer count register
- 16 data/address lines (multiplexed) and 7 bidirectional address lines
- Maximum transfer rate of 4Mbytes per second
- Signetics ISL bipolar technology
- 48-pin DIP

MICROPROCESSOR DIVISION

MEMORY MANAGEMENT UNIT SCN68451

DESCRIPTION

The SCN68451 Memory Management Unit (MMU) provides address translation and protection of the 16-megabyte addressing space of the SCN68000. The MMU can be accessed by any potential bus master, such as instruction set processors, or DMA controllers. Each bus master (or processor) in the SCN68000 family provides a function code and an address during each bus cycle. The function code specifies an address space while the address specifies a location within that address space. The function codes are provided by the SCN68000 to distinguish between program and data spaces as well as supervisor and user spaces. This separation of address spaces provides the basis of protection in an operating system. By simplifying the programming model of the address space, the MMU also increases the reliability of a complex multiprocess system.

FEATURES

- Separates address spaces of system and user resources
- Provides write protection
- Increases system reliability
- Provides efficient memory allocation
- Allows interprocess communication through shared resources
- Simplifies programming model of address space
- Minimizes operating system overhead with quick context switches
- 32 segments with variable segment sizes
- Multiple MMU system capability
- Supports both paging and segmentation
- DMA compatible
- Provides virtual memory support
- SCN68000 bus compatible

MICROPROCESSOR DIVISION

DUAL ASYNCHRONOUS RECEIVER/TRANSMITTER (DUART) SCN68681

DESCRIPTION

The Signetics SCN68681 Dual Universal Asynchronous Receiver/Transmitter (DUART) is a single chip MOS-LSI communications device that provides two independent, full-duplex, asynchronous receiver/transmitter channels in a 40-pin package. It interfaces directly with the SCN68000 16-bit CPU and other microprocessors and may be used in a polled or interrupt driven system.

The operating mode and data format of each channel can be programmed independently. Additionally, each receiver and transmitter can select its operating speed as one of 18 fixed baud rates, a 16× clock derived from a programmable counter/timer, or an external 1× or 16× clock. The baud rate generator and counter/timer can operate directly from a crystal or from external clock inputs. The ability to independently program the operating speed of the receiver and transmitter make the DUART particularly attractive for dual-speed channel applications such as clustered terminal systems.

Each receiver is quadruply buffered to minimize the potential of receiver overrun or to reduce interrupt overhead in interrupt driven systems. In addition, a handshaking capability is provided to disable a remote DUART transmitter when the buffer of the receiving device is full.

Also provided on the SCN68681 are a multipurpose 6-bit input port and a multipurpose 8-bit output port. These can be used as general-purpose I/O ports or can be assigned specific functions (such as clock inputs or status/interrupt outputs) under program control.

The SCN68681 is similar to the Signetics SCN2681, differing primarily in that the SCN68681 bus interface is compatible with the SCN68000 16-bit microprocessor. Refer to the SCN2681 data sheet for operational details.

FEATURES

- S68000 compatible bus interface
- Dual, full-duplex, asynchronous receiver/transmitter
- Quadruple buffered receiver data registers
- Programmable data format
  - 5 to 8 data bits plus parity
  - Odd, even, no parity or force parity
  - 1, 1.5 or 2 stop bits programmable in 1/16-bit increments
- Programmable baud rate for each receiver and transmitter selectable from
  - 18 fixed rates: 50 to 38.4K baud
  - One user-defined rate derived from programmable timer/counter
  - External 1X or 16X clock
- Parity, framing, and overrun error detection
- False start bit detection
- Line break detection and generation
- Programmable channel mode
  - Normal (full duplex)
  - Automatic echo
  - Local loopback
  - Remote loopback
- Multi-function programmable 16-bit counter/timer
- Multi-function 6-bit input port
  - Can serve as clock or control inputs
  - Change of state detection on four inputs
- Multi-function 8-bit output port
  - Individual bit set/reset capability
  - Outputs can be programmed to be status/interrupt signals
- Versatile interrupt system
  - Single interrupt output with eight maskable interrupting conditions
  - Interrupt vector output on interrupt acknowledge
  - Output port can be configured to provide a total of up to six separate wire-OR'able interrupt outputs
- Maximum data transfer: 1X — 1MB/sec, 16X — 125KB/sec
- Automatic wake-up mode for multidrop applications
- Start-end break interrupt/status
- Detects break which originates in the middle of a character
- On-chip crystal oscillator
- TTL compatible
- Single +5V power supply

SY6500

8-Bit Microprocessor Family

Features

- Single 5 V ±5% power supply
- N channel, silicon gate, depletion load technology
- Eight bit parallel processing
- 56 Instructions
- Decimal and binary arithmetic
- Thirteen addressing modes
- True indexing capability
- Programmable stack pointer
- Variable length stack
- Interrupt capability
- Non-maskable interrupt
- Use with any type or speed memory
- Bi-directional Data Bus
- Instruction decoding and control
- Addressable memory range of up to 65 K bytes
- "Ready" input
- Direct memory access capability
- Bus compatible with MC6800
- Choice of external or on-board clocks
- 1 MHz, 2 MHz, 3 MHz and 4 MHz operation
- On-chip clock options
  - * External single clock input
  - * Crystal time base input
- 40 and 28 pin package versions
- Pipeline architecture

Description

The SY6500 Series Microprocessors represent the first totally software compatible microprocessor family. This family of products includes a range of software compatible microprocessors which provide a selection of addressable memory range, interrupt input options and on-chip clock oscillators and drivers. All of the microprocessors in the SY6500 family are software compatible within the group and are bus compatible with the MC6800 product offering.

The family includes six microprocessors with on-board clock oscillators and drivers and four microprocessors driven by external clocks. The on-chip clock versions are aimed at high performance, low cost applications where single phase inputs or crystals provide the time base. The external clock versions are geared for the multi-processor system applications where maximum timing control is mandatory. All versions of the microprocessors are available in 1 MHz, 2 MHz, 3 MHz and 4 MHz maximum operating frequencies.

SY6520/SY6520A
SY6820/SY68B20
Peripheral Interface Adapter (PIA)

Features

- Direct Replacement for MC6820
- Single +5V Power Supply
- Two 8-bit Bi-directional I/O Ports with Individual Data Direction Control
- CMOS-Compatible Peripheral Port A Lines
- Automatic "Handshake" Control of Data Transfers
- Programmable Interrupt Capability
- Automatic Initialization on Power Up
- 1 and 2 MHz Versions

Description

The SY6520 Peripheral Interface Adapter (PIA) is designed to provide a broad range of peripheral control to microcomputer systems. Control of peripheral devices is accomplished through two 8-bit bi-directional I/O ports. Each I/O line may be programmed to be either an input or an output. In addition, four peripheral control lines are provided to perform "handshaking" during data transfers.

SY6521/SY6821
SY6521A/SY68B21

Peripheral Interface Adapter (PIA)

Features

- Extended Performance Version of SY6520
- Single +5V Power Supply
- Two 8-bit Bi-directional I/O Ports with Individual Data Direction Control
- CMOS-Compatible Peripheral Port A lines
- Automatic "Handshake" Control of Data Transfers
- Programmable Interrupt Capability
- Automatic Initialization on Power Up
- 1 and 2 MHz Versions
- Direct Replacement for MC6821

Description

The SY6521 Peripheral Interface Adapter (PIA) is designed to provide a broad range of peripheral control to microcomputer systems. It is functionally compatible with the SY6520, but with more drive capability and improved performance. Control of peripheral devices is accomplished through two 8-bit bi-directional I/O ports. Each I/O line may be programmed to be either an input or an output. In addition, four peripheral control lines are provided to perform "handshaking" during data transfers.

SY6522/SY6522A

Versatile Interface Adapter (VIA)

Features

- Two 8-Bit Bidirectional I/O Ports
- Two 16-Bit Programmable Timer/Counters
- Serial Data Port
- Single +5V Power Supply
- TTL Compatible
- CMOS Compatible Peripheral Port A lines
- Expanded "Handshake" Capability Allows Positive Control of Data Transfers Between Processor and Peripheral Devices
- Latched Output and Input Registers
- 1 MHz and 2 MHz Operation

Description

The SY6522 Versatile Interface Adapter (VIA) is a very flexible I/O control device. In addition, this device contains a pair of very powerful 16-bit interval timers, a serial-to-parallel/parallel-to-serial shift register and input data latching on the peripheral ports. Expanded handshaking capability allows control of bi-directional data transfers between VIA's in multiple processor systems.

Control of peripheral devices is handled primarily through two 8-bit bi-directional ports. Each line can be programmed as either an input or an output. Several peripheral I/O lines can be controlled directly from the interval timers for generating programmable frequency square waves or for counting externally generated pulses. To facilitate control of the many powerful features of this chip, an interrupt flag register, an interrupt enable register and a pair of function control registers are provided.

SY6530

Memory, I/O, Timer Array

Features

- 8 bit bi-directional Data Bus for direct communication with the microprocessor
- 1024 x 8 ROM
- 64 x 8 static RAM
- Two 8 bit bi-directional data ports for interface to peripherals
- Two programmable I/O Peripheral Data Direction Registers
- Programmable Interval Timer
- Programmable Interval Timer Interrupt
- TTL & CMOS compatible peripheral lines
- Peripheral pins with Direct Transistor Drive Capability
- High Impedance Three-State Data Pins
- Allows up to 7K contiguous bytes of ROM with no external decoding

Description

The SY6530 is designed to operate in conjunction with the SY6500 microprocessor Family. It is comprised of a mask programmable 1024 x 8 ROM, a 64 x 8 static RAM, two software controlled 8 bit bi-directional data ports allowing direct interfacing between the microprocessor unit and peripheral devices, and a software programmable interval timer with interrupt, capable of timing in intervals from 1 to 262,144 clock periods.

Synertek.

SY6532

RAM, I/O, Timer Array

Features

- 8 Bit Bi-directional Data Bus for Direct Communication with the Microprocessor
- Programmable Edge-Sensitive Interrupt
- 128 x 8 Static RAM
- Two 8 Bit Bi-directional Data Ports for Interface to Peripherals
- Two Programmable I/O Peripheral Data Direction Registers
- Programmable Interval Timer
- Programmable Interval Timer Interrupt
- TTL & CMOS Compatible Peripheral Lines
- Peripheral Pins with Direct Transistor Drive Capability
- High Impedance Three-State Data Pins

Description

The SY6532 is designed to operate in conjunction with the SY6500 Microprocessor Family. It is comprised of a 128 x 8 static RAM, two software controlled 8 bit bi-directional data ports allowing direct interfacing between the microprocessor unit and peripheral devices, a software programmable interval timer with interrupt capable of timing in various intervals from 1 to 262, 144 clock periods, and a programmable edge-detect interrupt circuit.

SY6545R
SY6845R
CRT Controller

PRELIMINARY

Features

- Single +5 volt (±5%) power supply.
- Alphanumeric and limited graphics capabilities.
- Fully programmable display (rows, columns, blanking, etc.).
- Interlaced or non-interlaced scan.
- 50/60 Hz operation.
- Fully programmable cursor.
- External light pen capability.
- Capable of addressing up to 16K character Video Display RAM.
- No DMA required.
- Pin-compatible with MC6845.
- 3.7 MHz Character Clock
- Internal status register.

Description

The SY6545 is a CRT Controller intended to provide capability for interfacing any microprocessor to a CRT or TV-type raster scan display. A unique feature is the inclusion of several modes of operation, so that the system designer can configure the system with a wide assortment of techniques. This part is also a direct replacement for the ML6845R.

SY68045

CRT Controller (CRTC)

Features

- Generates Refresh Addresses and Row Selects
- Generates Video Monitor Inputs: Horizontal and Vertical Sync and Display Enable
- Low Cost; MC6845, SY6545 Pin Compatible
- Text Can Be Scrolled on a Character, Line or Page Basis
- Addresses 16K Bytes of Memory
- Screen Can Be Up to 128 Characters Tall by 256 Wide
- Characters Can be 32 Lines High with any Width
- Two Complete ROM Programs
- Cursor and/or Display Can Be Delayed 0, 1 or 2 Clock Cycles
- Four Cursor Modes:
  - — Non-Blink
  - — Slow Blink
  - — Fast Blink
  - — Reverse Video With Addition of a Single TTL Gate
- Three Interlace Modes
  - — Normal Sync
  - — Interlace Sync
  - — Interlace Sync and Video
- Full Hardware Scrolling
- NMOS Silicon Gate Technology
- TTL-Compatible, Single +5 Volt Supply

SY6551

Asynchronous Communication Interface Adapter

Features

- On-chip baud rate generator: 15 programmable baud rates derived from a standard 1.8432 MHz external crystal (50 to 19,200 baud).
- Programmable interrupt and status register to simplify software design.
- Single +5 volt power supply.
- Serial echo mode.
- False start bit detection.
- 8-bit bi-directional data bus for direct communication with the microprocessor.
- External 16x clock input for non-standard baud rates (up to 125 Kbaud).
- Programmable: word lengths; number of stop bits; and parity bit generation and detection.
- Data set and modem control signals provided.
- Parity: (odd, even, none, mark, space).
- Full-duplex or half-duplex operation.
- 5, 6, 7, 8 and 9 bit transmission.

Description

The SY6551 is an Asynchronous Communication Adapter (ACIA) intended to provide for interfacing the 6500/6800 microprocessor families to serial communication data sets and modems. A unique feature is the inclusion of an on-chip programmable baud rate generator, with a crystal being the only external component required.

SY6591/SY6591A

Floppy Disk Controller (FDC)

Features

- Functionally compatible with SY1791-02/SY1793-02
- MPU bus interface directly compatible with SY6500 and MC6800 microprocessors.
- Single 5 volt power supply
- Accommodates both single-density (FM) and double-density (MFM) formats
- IBM format compatibility:
  - IBM 3740 Single-Density
  - IBM System-34 Double-Density

Description

The SY6591 Floppy Disk Controller is a fully programmable device intended for SY6500 or MC6800 microprocessor-based systems. Floppy disk control functions are fully autonomous and are thoroughly described in the SY1791-02/SY1793-02 data sheet. The SY6591 version is different only in the MPU bus interface characteristics.

SY1791-02/SY1793-02

Floppy Disk Controller (FDC)

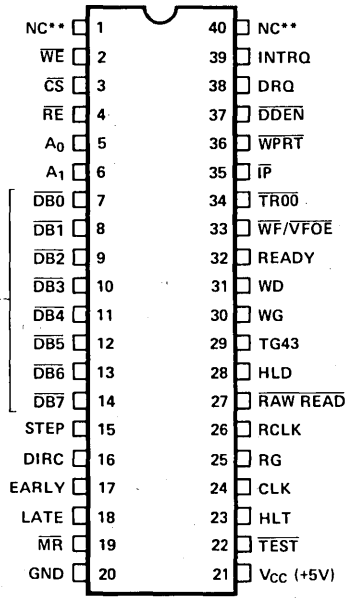
Features

- Pin and function compatible with Western-Digital FD1791-02 and FD1793-02
- Single 5-volt power supply
- Accommodates both single-density (FM) and double-density (MFM) formats
- IBM format compatibility:
  IBM 3740 single-density
  IBM System-34 double-density
- Numerous automatic control functions

Description

The SY1791-02/SY1793-02 Floppy Disk Controller is a fully programmable device intended for microprocessor based systems. Autonomous operation permits complete control of floppy disk functions with minimum CPU intervention required. Programmability is provided to allow either single-density (FM) or double-density (MFM) formats compatible with IBM standards, or formats uniquely defined by the user. The SY1791-02 uses negative-true data bus logic; the SY1793-02 uses positive-true.

Pin Configuration



*1793-02 HAS POSITIVE-TRUE DATA BUS LOGIC.

**NC PINS ARE INTERNALLY OPEN CIRCUITED. VOLTAGES APPLIED TO THESE PINS HAVE NO AFFECT.

SY2661

Enhanced Programmable Communications Interface

Features

SYNCHRONOUS OPERATION

- 5 to 8-bit characters plus parity
- Single or double SYN operation
- Internal or external character synchronization
- Transparent or non-transparent mode
- Transparent mode DLE stuffing (Tx) and detection (Rx)
- Automatic SYN or DLE-SYN insertion
- SYN, DLE and DLE-SYN stripping
- Odd, even, or no parity
- Local or remote maintenance loop back mode
- Baud rate: dc to 1M bps (1X clock)
- Pin & Function Compatible with Signetics 2661

ASYNCHRONOUS OPERATION

- 5 to 8-bit characters plus parity
- 1, 1½ or 2 stop bits transmitted
- Odd, even, or no parity
- Parity, overrun and framing error detection
- Line break detection and generation
- False start bit detection
- Automatic serial echo mode (echoplex)
- Local or remote maintenance loop back mode
- Baud rate: dc to 1M bps (1X clock)
  - — dc to 62.5K bps (16X clock)
  - — dc to 15.625K bps (64X clock)

OTHER FEATURES

- Internal or external baud rate clock
- 3 baud rate sets (2661-1, -2, -3)
- 16 internal rates for each set
- Double buffered transmitter and receiver
- Dynamic character length switching
- Full or half duplex operation
- TTL compatible inputs and outputs
- RxC and TxC pins are short circuit protected
- 3 open drain MOS outputs can be wire-ORed
- Single 5V power supply
- No system clock required
- 28-pin dual-in-line package

Pin Configuration

Z8601/Z8601A

Single-Chip Microcomputer with 2K ROM

Features

- Complete microcomputer with on-chip RAM, ROM and I/O
  - — 128 bytes of on-chip RAM
  - — 4K bytes of on-chip ROM
  - — 32 I/O lines
- Two programmable 8-bit counter/timers, each with a 6-bit programmable prescaler
- Full-duplex UART clocked by an internal timer
- 144-byte register file includes:
  - — 124 general-purpose registers, each of which can be used as an accumulator, index register, storage element, address register or part of the internal stack
  - — Four I/O port registers
  - — Sixteen status and control registers
- Register pointer permits shorter, faster instructions to access one of nine working-register groups
- Vectored, prioritized interrupts for I/O, counter/timers and UART
- Expandable bus interfaces up to 60K bytes each of external program memory and external data memory
- On-chip oscillator can be driven by a crystal, RC, LC or external clock source
- High-speed instruction execution

	8601	8601A
— Working-register operations =	1.5 μs	1.0 μs
— Average instruction execution =	2.2 μs	1.4 μs
— Longest instruction =	5.0 μs	3.4 μs

- Low-power standby mode retains contents of general-purpose registers
- Single +5 V supply
- All I/O pins TTL compatible

Description

The Z8 microcomputer introduces a new level of sophistication to single-chip architecture. Compared to earlier single-chip microcomputers, the Z8 offers faster execution; more efficient use of memory; more sophisticated interrupt, input/output and bit-manipulation capabilities; and easier system expansion.

Under program control, the Z8 can be tailored to the needs of its user. It can be configured as a stand-alone microcomputer with 2K of internal ROM, a traditional microprocessor that manages up to 120K of external memory, or a parallel-processing element in a system with other processors and peripheral controllers linked by the Z-Bus. In all configurations, a large number of pins remain available for I/O.

Z8602/Z8602A

Development Device with Memory Interface

Features

- Complete microcomputer with on-chip RAM, ROM and I/O
  - 128 bytes of on-chip RAM
  - 4K bytes of on-chip ROM
  - 32 I/O lines
- Two programmable 8-bit counter/timers, each with a 6-bit programmable prescaler
- Full-duplex UART clocked by an internal timer
- 144-byte register file includes:
  - 124 general-purpose registers, each of which can be used as an accumulator, index register, storage element, address register or part of the internal stack
  - Four I/O port registers
  - Sixteen status and control registers
- Register pointer permits shorter, faster instructions to access one of nine working-register groups
- Vectored, prioritized interrupts for I/O, counter/timers and UART
- Expandable bus interfaces up to 60K bytes each of external program memory and external data memory
- On-chip oscillator can be driven by a crystal, RC, LC or external clock source
- High-speed instruction execution

	8602	8602A
— Working-register operations =	1.5 μs	1.0 μs
— Average instruction execution =	2.2 μs	1.4 μs
— Longest instruction =	5.0 μs	3.4 μs

- Low-power standby mode retains contents of general-purpose registers
- Single +5 V supply
- All I/O pins TTL compatible

Description

The functions of the Z8602 I/O lines, $\overline{AS}$, $\overline{DS}$, R/$\overline{W}$, XTAL1, XTAL2 and $\overline{RESET}$ are identical to those of their Z8601 counterparts. The functions of the remaining 24 pins are as follows:

A_0-A_{11}. *Program Memory Address* (outputs). A_0-A_{11} access the first 2K bytes of program memory.

D_0-D_7. *Program Data* (inputs). Program data from the first 4K bytes of program memory is input through pins D_0-D_7.

$\overline{MDS}$. *Program Memory Data Strobe* (output, active Low). $\overline{MDS}$ is Low during an instruction fetch cycle when the first 2K bytes of program memory are being accessed. MDS remains High during other program memory read cycles.

$\overline{SYNC}$. *Instruction Sync* (output, active Low). This strobe output is forced Low during the internal clock period preceding the beginning of an opcode fetch.

SCLK. *System Clock* (output). SCLK is the internal clock output through a buffer. The clock rate is equal to one-half the crystal frequency.

IACK. *Interrupt Acknowledge* (output, active High). IACK is driven High in response to an interrupt during the interrupt machine cycle.

Z8603/Z8603A

Prototyping Device with EPROM Piggyback

Features

- Prototyping version of Synertek Z8601
- Piggyback 2716 EPROM program memory.
- Pin-compatible with Z8601 masked-ROM for hardware debugging or low-volume production.
- Complete microcomputer on-chip
  - 128 bytes of on-chip data RAM
  - 32 I/O lines
  - Socket for 2716 4K x 8 EPROM
- Two 14-bit counter/timers.
- Duplex UART and baud-rate generator.
- Vectored priority interrupt system.
- Up to 62K of external data memory.
- Up to 62K of external program memory.
- On-chip cyrstal, RC, or LC oscillator.
- High-speed instruction execution.

	8603	8603A
Working-register operations =	1.5 μs	1.0 μs
Average instruction =	2.2 μs	1.4 μs

- Single +5V supply voltage.
- All inputs/outputs TTL compatible.

Description

The Synertek Z8603 Microcomputer Protopak Emulator is a ROM-less version of the Synertek 2K Z8 single-chip microcomputer. A removable 2716 EPROM plugged into the 24-pin "piggy-back" socket atop the Z8603 allows pin-compatible emulation of the Z8601 masked-ROM version.

Z8613

Prototyping Device with EPROM Piggyback

Features

- Prototyping version of Synertek 8611
- Piggyback 2732 EPROM program memory.
- Pin-compatible with Z8611 masked-ROM for hardware debugging or low-volume production.
- Complete microcomputer on-chip
  - 128 bytes of on-chip data RAM
  - 32 I/O lines
  - Socket for 2732 4K x 8 EPROM
- Two 14-bit counter/timers.
- Duplex UART and baud-rate generator.
- Vectored priority interrupt system.
- Up to 60K of external data memory.
- Up to 60K of external program memory.
- On-chip cyrstal, RC, or LC oscillator.
- High-speed instruction execution. 8613 8613A
  - Working-register operations = 1.5 μs 1.0 μs
  - Average instruction = 2.2 μs 1.4 μs
- Single +5V supply voltage.
- All inputs/outputs TTL compatible.

Description

The Synertek Z8613 Microcomputer Protopack Emulator is a ROM-less version of the Synertek 4K Z8 single-chip microcomputer. A removable 2732 EPROM plugged into the 24-pin "piggy-back" socket atop the Z8613 allows pin-compatible emulation of the Z8611 masked-ROM version.

Z8681

Z8 Family
Z8681 Microcomputer

Features

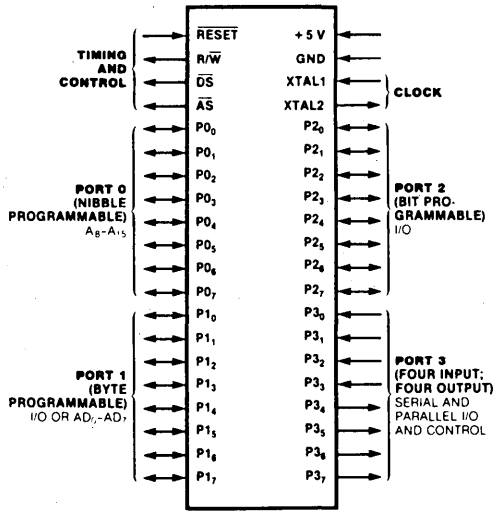
- "ROMless" version of the Z8601 Single-Chip Microcomputer, capable of Addressing up to 128K Bytes of External Memory Space
- Up to 24 Programmable I/O Lines
- 40-pin Package, Single +5 V supply, all Pins TTL Compatible

Description

The Z8681 MCU is the "ROMless" version of the Z8601 single-chip microcomputer and offers all the outstanding features of the Z8 Family architecture. Using the Z8681, it is possible to design a powerful microprocessor system incorporating a minimum number of support devices.

Port 1 is configured to function as a multiplexed Address/Data bus (AD_0-AD_7), while Port 0 is software configurable to output address bits A_8-A_{15}. This provides for program memory and data memory space of up to 64K bytes each. Located on-chip are 144 bytes of RAM, organized as a register file of 124 general-purpose registers, 16 control and status registers, and three I/O port registers. (Port 1 cannot be utilized as an I/O register.) This file is divided into groups of working registers in such a way that short format instructions may be used to quickly access a register within a certain group.

Pin Functions



Pin Configuration

Synertek.

Z8S MCU
Microcomputer

Features

- Complete microcomputer with on-chip RAM, ROM and I/O
  - o 64 bytes of on-chip RAM
  - o 1K bytes of on-chip ROM
  - o 30 I/O lines
- Subset of Z8 instruction set
- Only 2 pins differ from those of Z8 offering easy upgrade
- One programmable 8-bit counter/timer with a 6-bit programmable prescaler
- Ability to force all program memory fetches to reference external memory
- 75-byte register file includes:
  - o 60 general-purpose registers, each of which can be used as an accumulator, index register, storage element, address register or part of the internal stack
  - o Four I/O port registers
  - o Eleven status and control registers for programming and polling the Z8S Microcomputer
- Register pointer permits shorter, faster instructions to access one of five working-register groups
- Vectored interrupts for I/O and counter/timers
- Expandable bus interfaces up to 4K bytes of external program memory and 3K bytes of external data memory
- On-chip oscillator can be driven by a crystal, RC, LC or external clock source
- High-speed instruction execution
  - o Working-register operations = 1.5 μs
  - o Average instruction execution = 2.2 μs
  - o Longest instruction = 4.25 μs
- Optional low-power standby mode retains contents of general-purpose registers
- Single +5V supply
- All pins TTL compatible

Description

The Z8S microcomputer introduces a new level of sophistication to low-end single-chip architecture. It retains the power and versatility of the Z8 architecture while halving the ROM and RAM. Compared to earlier low-end single-chip microcomputers, the Z8S offers faster execution, more efficient use of memory, more sophisticated I/O and bit-manipulation capabilities, and easier system expansion.

Under program control, the Z8S can be tailored to the needs of its user. It can be configured as a stand-alone microcomputer with 1k of ROM and 30 I/O lines. If the user needs more program or data memory, some of the I/O pins may be traded off as external address lines. Thus, the Z8S may also address up to an extra 3k of external program or external data memory (or both for 6 external kilobytes). Programs that grow beyond these bounds are best served by the Z8. The Z8 and Z8S differ only in two pins, interrupt vectors, and some on-chip resources (memory, timer, UART, options).

Z8 is a trademark of Zilog, Inc.

Z86C01

Single-Chip CMOS Microcomputer with 2K ROM

Features

- Complete CMOS microcomputer with on-chip RAM, ROM and I/O
  - 128 bytes of on-chip RAM
  - 4K bytes of on-chip ROM
  - 32 I/O lines
- Two programmable 8-bit counter/timers, each with a 6-bit programmable prescaler
- Full-duplex UART clocked by an internal timer
- 144-byte register file includes:
  - 124 general-purpose registers, each of which can be used as an accumulator, index register, storage element, address register or part of the internal stack
  - Four I/O port registers
  - Sixteen status and control registers
- Pin, function and object code compatible with Synertek HMOS Z8601 MCU
- Register pointer permits shorter, faster instructions to access one of nine working-register groups
- Vectored, prioritized interrupts for I/O, counter/timers and UART
- Expandable bus interfaces up to 60K bytes each of external program memory and external data memory
- On-chip oscillator can be driven by a crystal, RC, LC or external clock source
- High-speed instruction execution
  - Working-register operations = 1.5 μs
  - Average instruction execution = 2.2 μs
  - Longest instruction = 5 μs
- Low-power standby mode retains contents of general-purpose registers
- Single +5 V supply
- All I/O pins TTL compatible

Description

The Z86C01 is an implementation of the powerful Z8 architecture in a high performance, N-well HCMOS process. The Z86C01 is capable of performing in the same socket as a Z8601 with at least an order of magnitude savings in power consumption. It is the first in a line of Synertek CMOS microcomputers based on the Z8 architecture. Future members of the family will have architectural enhancements in order to optimize speed/power performance, as well as different amounts of memory and I/O capabilities.

SY66016
High-Speed 16 x 16 Parallel Multiplier

Features

- High-Speed 16 x 16 Parallel Array Multiplier
- 100 nsec Typical Multiply Time
- Low Power (I_{CC} = 300 mA Typical)
- Full Product Multiplexed at Output
- 2's Complement, Unsigned or Mixed Operands
- Input/Output Latches Selectable for Clocked or Transparent Mode of operation
- Advanced HMOS Technology
- Input/Output Levels TTL Compatible
- Single +5V Power Supply
- SY66016 Pin-for-Pin Functional Replacement for TRW MPY 16HJ and AMD 29516

Description

The SY66016 is a parallel array multiplier built using Synertek's advanced HMOS process technology. By use of a modified Booths algorithm and the state-of-the-art 2μ design rules, the SY66016 provides a performance comparable to existing bipolar TTL multipliers at less than half the power consumption (I_{CC} = 300 mA typical).

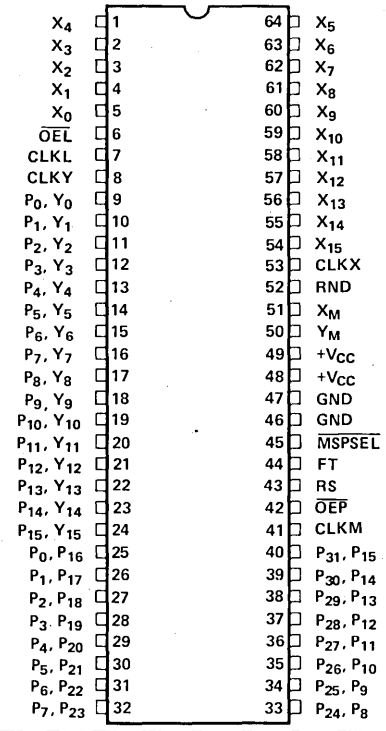
Input data is accepted in the form of 16-bit 2's complement and unsigned magnitude or mixed operands. At the output of the array a format adjust control (FA) allow the user to select a full 32-bit product or a left shifted 31-bit product suitable for 2's-complement only.

The two halves of the product may be routed to a 16-bit three-state output port via a multiplexer. In addition the LSP is connected to the Y-input through a separate three-state buffer.

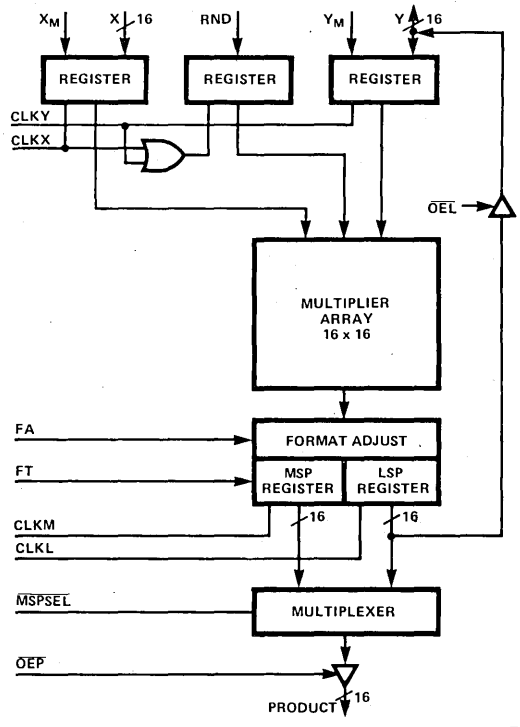
Applications of the SY66016 multiplier include a variety of digital signal-processing systems including floating-point processors, FFT processors, array processors, image/video processors, speech recognition and synthesis, digital filtering, modems, missile guidance, etc.

In the SY66016 the X, Y, MSP and LSP registers have independent clocks (CLKX, CLKY, CLKM, CLKL). The output multiplexer control ($\overline{\text{MSPSEL}}$) uses a pin which is a supply ground in the TRW MPY 16HJ. When this control is LOW the function is that of the MPY 16HJ, thus allowing full compatibility.

PIN CONFIGURATION



Block Diagram



© IC MASTER 1983

Definition of Signals

X_{15}-X_0	Multiplicand Data inputs.
Y_{15}-Y_0	Multiplier Data inputs or least significant product (LSP) output.
X_M, Y_M (TCX, TCY)*	Mode control inputs for each data word; LOW for unsigned data and HIGH for 2's complement data.
FA (RS)*	Format adjust control selects either a full 32-bit product (HIGH) or a left shifted 31-bit product with the sign bit replicated in the LSP (LOW). This control is normally high, except for certain fractional 2's complement applications.
FT	Feedthrough control (HIGH) makes both MSP and LSP registers transparent.
$\overline{\text{MSPSEL}}$	Selects either MSP (LOW) or LSP (HIGH) to be available at the product output port.
RND	Round control for the rounding of the MSP.
$\overline{\text{OEP}}$ (TRIM)*	Three-state enable for product output port.
$\overline{\text{OEL}}$ (TRIL)*	Three-state enable for routing LSP through Y input/output port.
CLKX	Register Clock, $X_{15\text{-}0}$, X_M, RND
CLKY	Register Clock, $Y_{15\text{-}0}$, Y_M, RND
CLKM	MSP Register Clock
CLKL	LSP Register Clock

*TRW MPY 16HJ pin designation.
